Preface

Software code for processing satellite data may become very complex. On the one hand, it consists of code related to the technical details of the satellite and instruments; on the other hand, the code drives complex algorithms to create the physical end products. Therefore, the EUMETSAT Satellite Application Facility (SAF) project for Numerical Weather Prediction (NWP) has included some explicit activities aiming at enhancing the modularity, readability and portability of the processing code.

For several years, the KNMI observation research group has been developing processing code to supply Near Real Time (NRT) level 2 surface wind products based on the ERS and SeaWinds Scatterometer level 1b Normalized Radar Cross Section data (σ^0). This work is coordinated and supervised by Ad Stoffelen. In the beginning only an adaptation of his ERS code existed. Later Marcos Portabella and Julia Figa added modifications and extensions to improve, e.g., the wind retrieval and quality control algorithms. In 2003, John de Vries finished the first official release of a processor within the NWP SAF. This processor was called the QuikSCAT Data Processor (QDP).

Meanwhile, Jos de Kloe has been updating the code for ERS scatterometer wind processing. For many parts of the process steps (e.g., the BUFR handling and part of the wind retrieval) a large overlap with SeaWinds Data processing coding exists. The KNMI Scatterometer Team is working towards generic NRT scatterometer processing. As a result, a new modular processing code for SeaWinds data was developed within the NWP SAF: the SeaWinds Data Processor (SDP) as successor of QDP.

Based on the generic code already available for SeaWinds and ERS processing, a new ASCAT Wind Data Processor (AWDP) was developed. This document is the corresponding reference manual. I hope this manual will strongly contribute to the comprehension of future developers and of users interested in the details of the processing.

Many persons contributed (directly or indirectly) to the development of the scatterometer software at KNMI: Hans Bonekamp, Jos de Kloe, Marcos Portabella, Ad Stoffelen, Anton Verhoef, Jeroen Verspeek, Jur Vogelzang and John de Vries are (in alphabetical order) the most important contributors.

Anton Verhoef, June 2007

Chapter 1

Introduction

1.1 Aims and scope

The ASCAT Wind Data Processor (AWDP) is a software package written in Fortran 90 for handling data from the Advanced Scatterometer (ASCAT) and European Remote Sensing satellite (ERS) scatterometer instruments. Details of these instruments can be found on several web sites and in several other documents, see e.g. [*Portabella*, 2002; *Stoffelen*, 1998] and information on the ESA and EUMETSAT web sites.

AWDP generates surface winds based on level 1b or level 2 ASCAT and ERS data. It allows performing the ambiguity removal with the Two-dimensional Variational Ambiguity Removal (2DVAR) method and it supports the Multiple Solution Scheme (MSS). The output of AWDP consists of wind vectors which represent surface winds within the ground swath of the scatterometer. Input of AWDP is Normalized Radar Cross Section (NRCS, σ^0) data. These data may be real-time. The input files of AWDP are in BUFR or Product Format Specification (PFS, native Metop) format. BUFR input may be provided using the BUFR templates for ERS or ASCAT; output is always written using the ASCAT BUFR template. Besides the nominal 25-km and 12.5-km products, AWDP also has the capability to generate a coastal wind product, where the backscatter data from the level 1b files are replaced by box-averaged backscatter values from the full resolution level 1 ASCAT product (SZF data). This mode of operation produces winds that are closer to the coast than the winds from the nominal level 1b data which contain backscatter values that are averaged using a Hamming filter, see [*Verhoef et. al.*, 2012]. Currently (2013), the SZF data are not available for users in near-real time, but only off-line from the EUMETSAT Data Centre.

Apart from the ASCAT input data, AWDP needs Numerical Weather Prediction (NWP) model winds as a first guess for the Ambiguity Removal step. These data need to be provided in GRIB edition 1 or 2.

1.2 Development of AWDP

AWDP is developed within the Numerical Weather Prediction Satellite Application Facility (NWP SAF) and Ocean and Sea Ice Satellite Application Facility (OSI SAF) programs as code which can be run in an operational setting. The coding is in Fortran 90 and has followed the procedures specified for the NWP SAF. Special attention has been paid to robustness and readability. AWDP

may be run on every modern Unix or Linux machine. In principle, AWDP can also be run on a Windows machine if a Unix emulator like Cygwin is installed.

1.3 Testing AWDP

Modules are tested by test programs and test routines. Many test routines or test support routines are part of the modules themselves. Test programs can be compiled separately. For the AWDP program, the description of the test programs and the results of the testing are reported in [*Verhoef et. al.*, 2013].

1.4 User Manual and Reference Guide

This document is intended as the complete reference book for AWDP.

Chapter 2 is the user manual (UM) for the AWDP program. This chapter provides the basic information for installing, compiling, and running AWDP. Chapter 3 contains the Product Specification (PS) of the AWDP program. Reading the UM and the PS should provide sufficient information to the user who wants to apply the AWDP program as a black box.

The subsequent chapters are of interest to developers and users who need more specific information on how the processing is done. The Top Level Design (TLD) of the code and the Module Design (MD) of the AWDP code can be found in Chapter 4. Several modules are very generic for NRT scatterometer data processing. Examples are the modules for the BUFR and GRIB handling, ambiguity removal, and parts of the wind retrieval. These generic modules are part of the generic scatterometer (genscat) layer and are described in Chapter 5 to Chapter 9.

The appendices of this document contain a complete calling tree of the AWDP program up to and including the genscat layer. The appendices also contain a list of ASCAT BUFR data descriptors and a list of acronyms.

1.5 Conventions

Names of physical quantities (e.g., wind speed components u and v), modules (e.g. *BufrMod*), subroutines and identifiers are printed italic.

Names of directories and subdirectories (e.g. awdp/src), files (e.g. awdp.F90), and commands (e.g. awdp -f input) are printed in Courier. Software systems in general are addressed using the normal font (e.g. AWDP, genscat).

Hyperlinks are printed in blue and underlined (e.g. http://www.knmi.nl/scatterometer/).

References are in square brackets with the name of the author italic (e.g. [Stoffelen, 1998]).

Chapter 2

AWDP User Manual

This chapter is the user manual of the AWDP program. Sections 2.1 and 2.2 give general information about AWDP. Section 2.3 provides information on how to install, compile, and link the AWDP software. The command line arguments of AWDP are discussed in section 2.4. Section 2.5 gives information on a script for running AWDP.

Please note that any questions or problems regarding the installation or use of AWDP can be addressed at the NWP SAF helpdesk at <u>http://www.nwpsaf.org/</u>.

2.1 Why using the AWDP program?

Scatterometers provide valuable observational data over the world's oceans. Therefore, successful assimilation of scatterometer data in numerical weather prediction systems generally improves weather forecasts. The AWDP program has been developed to fully exploit scatterometer data. It is meant to form the key component of the observation operator for surface winds in data assimilation systems.

The general scheme of AWDP (and any other wind scatterometer data processor) is given in figure 2.1. The input of the AWDP program is the EUMETSAT ASCAT level 1b BUFR or PFS wind product (combined with ASCAT level 1 full resolution data in PFS in the case of coastal wind product processing) or the ESA ERS level 2 BUFR wind product. Besides this, GRIB input containing land-sea mask, sea surface temperature or soil temperature on level 0, and first guess winds over the globe is necessary.

The AWDP processing chain contains several steps (see figure 2.1):

- 1. Pre-processing. The input file is decoded and the radar backscatter (σ^0) values are written in the data structures of AWDP. In the case of coastal product processing, the full resolution (SZF) backscatter data are read and averaged. Some quality control on the input data is done.
- 2. Collocation with NWP data. The GRIB edition 1 or 2 files containing NWP data are read and the values for land fraction, sea surface temperature and first guess winds are interpolated and stored with the information of each WVC.
- 3. Inversion. The σ^0 values are compared to the Geophysical Model Function (GMF) by means of a Maximum Likelihood Estimator (MLE). The wind vectors that give the best description of the σ^0 values (the solutions) are retained. The MLE is also used to assign a probability to each

wind vector. The normal scheme allows 2 solutions at most, but in the Multiple Solution Scheme (MSS) the maximum number of solutions is 144.

- 4. Quality Control. Solutions that lie far away from the GMF are likely to be contaminated by, e.g., sea ice or confused sea state. During Quality Control these solutions are identified and flagged.
- 5. Ambiguity Removal. This procedure identifies the most probable solution using some form of external information. AWDP uses a two-dimensional variational scheme (2DVAR) as default. A cost function is minimized that consists of a background wind field and all solutions with their probability, using meteorological balance, mass conservation and continuity as constraints.
- 6. Quality Monitoring. The last step is to output quality indicators to an ASCII monitoring file and to write the results in a BUFR format output file.

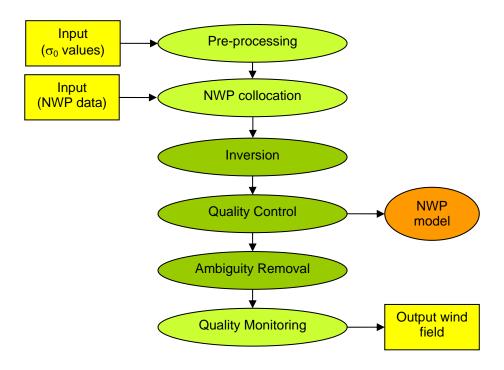

Figure 2.1 AWDP processing scheme. The wind vectors and their probabilities after Quality Control may be fed directly in the Data Assimilation step of a Numerical Weather Prediction model.

Step 1, 2 and 6 of the processing chain are rather trivial; the real work is done in steps 3, 4, and 5. Note that an undesirable dependency arises if the output wind field is assimilated into a numerical weather prediction (NWP) model: in the 2DVAR Ambiguity Removal step (i) a background wind field is used and (ii) meteorological balance constraints causing spatially correlated error. Therefore it is recommended to feed the wind solutions and their probabilities directly into the NWP data assimilation step after Quality Control, as indicated in figure 2.1. If this is done, the Ambiguity Removal step can be skipped and consequently, no forecast winds are necessary in the NWP input. No impact tests have been performed to date by assimilating AWDP outputs after ambiguity removal.

As further detailed in Chapter 3, AWDP profits from developments in

- Inversion and output of the full probability density function of the vector wind (Multiple Solution Scheme, MSS).
- Quality Control (QC).
- Meteorologically balanced Ambiguity Removal (2DVAR).
- Quality monitoring.
- Capability to process ASCAT data on both 25 km and 12.5 km cell spacing.

A complete specification of the AWDP program can be found in the Product Specification in Chapter 3. The program is based on generic genscat routines for inversion, ambiguity removal, and BUFR and GRIB file handling. These routines are discussed in more detail in Chapter 5 to Chapter 9.

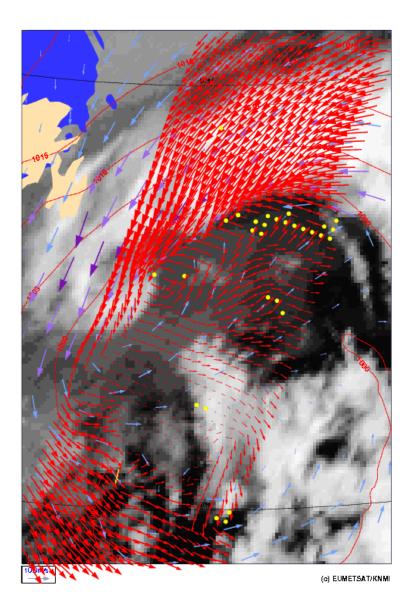

Figure 2.2 AWDP wind field retrieved for 15 April 2007, approximately 13 h UTC, at 25 km cell spacing, near Newfoundland overlaid on a GOES IR satellite image. The yellow dots are rejected WVCs. The blue and violet arrows are a 6 hours forecast from the KNMI HIRLAM model.

2.2 Modes of using AWDP

There are several modes to assimilate the ASCAT data in NWP models using AWDP. Anyway, the first thing to assure oneself of is the absence of biases by making scatter plots between ASCAT and NWP model first guess for at least wind speed, but wind direction and wind components would also be of interest to guarantee consistency.

The operational ASCAT wind product, available as a deliverable from the EUMETSAT OSI SAF project, could be the starting point for NWP assimilation:

- 1. The unique solution at every WVC may be assimilated as if it were buoy data. This is the fastest way and one exploits the data to a large extent. For a small advantage, AWDP could be installed to provide 2DVAR solutions based on the local first guess.
- 2. The AWDP software may be used to modify the 3DVAR or 4DVAR data assimilation system to work with the ambiguous wind solutions and their probabilities at every WVC. This represents some investment, but is applicable for all scatterometer data. The advantage with respect to option 1 in the ambiguity removal occurs only occasionally, but always in dynamic atmospheric cases (storms or cyclones) that are really relevant.

Both options can be based on AWDP in standard or MSS mode, and at various resolutions. MSS is somewhat more dependent on the first guess and balance constraints in 2DVAR than the standard AWDP, but much less noisy. A noticeable advantage is thus obtained by using option 2 and potentially the full hi-res benefit of the ASCAT data is achieved. The mode of using AWDP thus depends on the opportunities, experience, and time the user has to experiment with ASCAT data in the NWP system under consideration.

The AWDP program can, of course, also be used to create a stand-alone wind product, e.g., for nowcasting purposes. Such a stand-alone ASCAT wind product is a deliverable of the OSI SAF project. More information on this project can be found on <u>http://www.osi-saf.org/</u>.

2.3 Installing AWDP

AWDP is written in Fortran 90 (with a few low level modules in C) and is designed to run on a modern computer system under Linux or Unix. AWDP needs a Fortran 90 compiler and a C compiler for installation. AWDP comes along with a complete make system for compilation. In some cases, the Makefiles call installation scripts which are written in Bourne shell to enhance portability. When compiled, AWDP requires about 100-150 Mb disk space.

In principle, AWDP may also run under Windows. However, it needs the BUFR and GRIB API libraries from ECMWF, and this poses some restrictions on the systems supported. Under Windows one must use a (free) Unix emulator like Cygwin (see <u>http://www.cygwin.com/</u> for more information and download, and section 2.3.5 for some directions).

To install AWDP, the following steps must be taken:

1. Copy the AWDP package (file AWDP<version>.tar.gz) to the directory from which AWDP will be applied, and unzip and untar it. This will create subdirectories awdp and genscat that contain all code needed (see section 2.3.1), and a script called InstallAWDP for easy compilation.

- 2. Download the ECMWF BUFR library file bufr_000400.tar.gz (or another version not earlier than 000240 and not later than 000387) and copy it to directory genscat/support/bufr. Note that library versions 000388 and 000389 are not supported. See also section 2.3.2.
- 3. Download the ECMWF GRIB API library file grib_api-1.9.18.tar.gz (or another version not earlier than 1.9.0) and copy it to directory genscat/support/grib. See also section 2.3.3.
- 4. Go to the top directory and run the ./InstallAWDP script. The script will ask for the compiler used and it will invoke the make system for compilation and linking of the software (see also section 2.3.4).

AWDP is now ready for use, provided that the environment variables discussed in section 2.3.6 have the proper settings. See also sections 2.4 and 2.5 for directions on how to run AWDP.

2.3.1 Directories and files

All code for AWDP is stored in a file named AWDP<version>.tar.gz that is made available in the framework of the NWP SAF project. This file should be placed in the directory from which AWDP is to be run. After unzipping (with gunzip AWDP<version>.tar.gz) and untarring (with tar -xf AWDP<version>.tar), the AWDP package is extracted in subdirectories awdp and genscat, which are located in the directory where the tar file was located. Subdirectories awdp and genscat each contain a number of files and subdirectories. A copy of the release notes can also be found in the directory awdp/docs.

Tables 2.1 and 2.2 list the contents of directories awdp and genscat, respectively, together with the main contents of the various parts. Depending on the distribution, more directories may be present, but these are of less importance to the user.

Name	Contents
doc	Documentation, including this document
execs	Link to awdp executable, shell script for running AWDP
src	Source code for AWDP program and supporting routines
test	Example BUFR and GRIB input files for testing purposes.

Table 2.1Contents of directory awdp.

Name	Contents
ambrem	Ambiguity removal routines
ambrem/twodvar	KNMI 2DVAR ambiguity removal routines
inversion	Inversion and quality control routines
main	Dummy subdirectory to facilitate the make system
support	General purpose routines sorted in subdirectories
support/BFGS	Minimization routines needed in 2DVAR
support/bufr	BUFR tables (in subdirectory) and file handling routines
support/Compiler_Features	Compiler specific routines, mainly command line handling
support/convert	Conversion between wind speed/direction and u and v
support/datetime	Date and time conversion routines

Name	Contents
support/ErrorHandler	Error handling routines
support/file	File handling routines
support/grib	GRIB file handling routines
support/num	Numerical definitions and number handling routines
support/pfs	PFS file handling routines
support/singletonfft	FFT routines needed in minimization
support/sort	Sorting routines

Table 2.2 Contents of directory genscat.

Directories awdp and genscat and their subdirectories contain various file types:

- Fortran 90 source code, recognizable by the . F90 extension;
- C source code, recognizable by the .c extension;
- Files and scripts that are part of the make system for compilation like Makefile_thisdir, Makefile, use_, Objects.txt and Set_Makeoptions (see 2.3.4 for more details);
- Scripts for the execution of AWDP in directory awdp/execs;
- Look-up tables and BUFR tables needed by AWDP;
- Files with information like Readme.txt.

After compilation, the subdirectories with the source code will also contain the object codes of the various modules and routines.

2.3.2 Installing the BUFR library

AWDP needs the ECMWF BUFR library for its input and output operations. Only ECMWF is allowed to distribute this software. It can be obtained free of charge from ECMWF at the web page http://www.ecmwf.int/products/data/software/bufr.html. The package contains scripts for compilation and installation. The reader is referred to this site for assistance in downloading and installing the BUFR Library.

Directory genscat/support/bufr contains the shell script make.bufr.lib. It unzips, untars, and compiles the BUFR library file which is downloaded from ECMWF and placed into this directory. This script is part of the genscat make system and it is automatically invoked when compiling genscat. The current version is tested with BUFR version 000400, earlier versions between 000240 and 000387 can also be used. Note that library versions 000388 and 000389 are not supported.

BUFR file handling at the lowest level is difficult to achieve. Therefore some routines were coded in C. These routines are collected in library *bufrio* (see also section 8.4). Its source code is located in file bufrio.c in subdirectory genscat/support/bufr. Compilation is done within the genscat make system and requires no further action from the user (see 2.3.4).

2.3.3 Installing the GRIB API library

AWDP needs the ECMWF GRIB API library for its input operations. Only ECMWF is allowed to distribute this software. It can be obtained free of charge from ECMWF at the web page

<u>http://www.ecmwf.int/products/data/software/grib_api.html</u>. The package contains scripts for compilation and installation. The reader is referred to this site for assistance in downloading and installing the GRIB API Library.

Directory genscat/support/grib contains the shell script make.grib.lib. It unzips, untars, and compiles the GRIB API library file which is downloaded from ECMWF and placed into this directory. This script is part of the genscat make system and it is automatically invoked when compiling genscat. The current version is tested with GRIB API version 1.9.0, but later versions can be used. However, AWDP is not tested with later versions.

By default, the library for handling GRIB messages that are compressed using the JPEG algorithm, is not linked in the compilation process. This option can be activated by adding the link option -lopenjpeg to the Makeoptions file in directory genscat:

LINKFLAGS = \$(LIB) -lopenjpeg

After this change, the software in directories genscat/support/grib and awdp/src needs to be recompiled using the commands make clean and make.

2.3.4 Manual compilation and linking

Compilation and linking of AWDP under Linux or Unix is done in three steps:

- 1. Set the compiler environment variables according to the choice entered on request. This can be done by running the appropriate use_* scripts in directory genscat.
- 2. Go to directory genscat and type make.
- 3. Go to directory awdp and type make to produce the executable awdp in directory awdp/src.

Before activating the make system, some environment variables identifying the compiler should be set. These variables are listed in table 2.4. The environment variables in table 2.4 can be set by using one of the use_* scripts located in directory genscat. Table 2.5 shows the properties of these scripts. The scripts are available in Bourne shell (extension .bsh) and in C shell (extension .csh). Note that if one of the environment variables is not set, the default f90 and cc commands on the Unix platform will be invoked. Note that in the top directory a script called InstallAWDP is provided that asks the user which compiler he wants to use and invokes the appropriate use_* script (step 1 above), after which the compilation in the genscat and awdp directories is performed (steps 2 and 3 above).

Variable	Function
\$GENSCAT_F77	Reference to Fortran 77 compiler
\$GENSCAT_F90	Reference to Fortran 90 compiler
\$GENSCAT_CC	Reference to C compiler
\$GENSCAT_LINK	Reference to linker for Fortran objects
\$GENSCAT_CLINK	Reference to linker for C objects
\$GENSCAT_SHLINK	Reference to linker for shared objects

 Table 2.4
 Environment variables for compilation and linking.

Script	Fortran	С	Remarks
	compiler	compiler	
use_g95	g95	gcc	GNU compilers by A. Vaught
use_gfortran	gfortran	gcc	GNU-GCC 4.0 compiler collection
use_ifort	ifort	icc	Intel Fortran and C compilers
use_pgf90	pgf90	gcc	Portland Fortran compiler

Table 2.5 Properties of the use_* scripts.

<u>Example:</u> To select the GNU g95 compiler under Bourne, Bash or Korn shell type ". use_g95.bsh", the dot being absolutely necessary in order to apply the compiler selection to the current shell. Under C shell the equivalent command reads "source use_g95.csh".

If the user wants to use a Fortran or C compiler not included in table 2.6, he can make his own version of the use_* script, or set the environment variables for compilation and linking manually.

AWDP is delivered with a complete make system for compilation and linking under Unix or Linux. The make system is designed as portable as possible, and system dependent features are avoided. As a consequence, some tasks must be transferred to shell scripts. The make system consists of two parts: one for AWDP and one for genscat. The genscat part should be run first. For compilation and linking of the genscat part, the user should move to the genscat directory and simply enter make.

The Makefile refers to each subdirectory of genscat, invoking execution of the local Makefile and, in cases where a subdirectory contains code as well as a subdirectory containing code, Makefile_thisdir. The Makefiles need supplementary information from the files Objects.txt which are present in each directory containing code. The settings for the compilers are located in file Makeoptions in directory genscat. This file is generated by the Bourne shell script Set_Makeoptions which is called automatically by the genscat make system. The local Makefile in subdirectory genscat/support/bufr calls the script make.bufr.lib for compilation of the BUFR library (see 2.3.2). It also contains the Fortran program test_modules that generates the binary BUFR tables B and D from the ASCII tables already present, and is executed automatically by the make system. Program test modules can also be used to test the genscat BUFR module. The Makefile in subdirectory genscat/support/bufr/bufr_tables calls some shell scripts, which make symbolic links (using the ln -s command) of the generic binary BUFR tables B and D under different names. There are four different naming conventions in BUFR version 000240 to 000280, and binary files are generated for each of them. Symbolic links are not guaranteed to work on each platform (e.g. by some versions of Cygwin under Windows XP), so in some cases it may be necessary to replace the ln -s by cp (copy). Further information on the make system is given in the inline comments in the scripts and Makefiles.

Compilation and linking of the AWDP part is done in a similar manner: go to the awdp directory and enter make. As with genscat, the make system will execute Makefiles in every subdirectory of awdp. The result is the executable awdp in directory awdp/src and a symbolic link to this executable in awdp/execs. AWDP is now ready for use. The make system of AWDP doesn't

need any further files except the genscat file Makeoptions. This is the reason why genscat should be compiled first.

When recompiling (part of) AWDP or genscat with the make system, for instance when installing a new version of the BUFR library, one should be sure to enter make clean first. To recompile part of the software invoke the make system where needed. The compiler settings from file Makeoptions in directory genscat will be used again. If a change in these settings is necessary, type make clean in the genscat directory and Makeoptions will be removed. Don't forget to rerun the use_* commands to select the right compiler.

2.3.5 Some remarks for Cygwin users

AWDP can be used under Cygwin, a Unix emulator running under Windows. Installing and running AWDP under Cygwin is almost the same as under Unix or Linux, but the following points may be helpful for Cygwin users.

- The GNU g95 compiler comes standard with Cygwin (version 1.5.25-11 and later) so it is always possible to install AWDP using g95.
- Cygwin has its own path naming convention, for example: C:\awdp under Windows becomes /cygdrive/c/awdp under Cygwin.
- Don't forget to run the dos2unix command on scripts edited under Windows, otherwise Cygwin won't recognize the file as a script!

2.3.6 Environment variables

AWDP needs a number of environment variables to be set. These are listed in table 2.3 together with their possible values.

Name	Value
\$BUFR_TABLES	genscat/support/bufr/bufr_tables/
\$GRIB_DEFINITION_PATH	genscat/support/grib/definitions
\$INVERSION_LUTSDIR	genscat/inversion
\$LUT_FILENAME_C_VV	Any existing, writable path + file name

Table 2.3 Environment variables for AWDP.

The \$BUFR_TABLES variable guides AWDP to the BUFR tables needed to read the input and write the output. The \$GRIB_DEFINITION_PATH variable is necessary for a proper functioning of the GRIB decoding software.

The variable \$INVERSION_LUTSDIR should point to a directory containing some look up tables (extension .asc) that are used by the inversion software. The necessary tables are delivered with genscat.

The variable \$LUT_FILENAME_C_VV points AWDP to the correct C band GMF lookup table at VV polarisation. It should contain a file name including a valid path. If the file does not exist, it will be created when the inversion is invoked for the first WVC. In order to prevent confusion, it is advised to use standard file names cpath>/cmod5.dat, cpath>/cmod5_5.dat,

<path>/cmod5_n.dat, or <path>/cmod6.dat, since the inversion software uses the file
name to determine which CMOD version is used.

2.4 Command line options

The AWDP program is started from directory awdp/execs with the command

awdp [options/modes] -f <BUFR/PFS file> [-nwpfl <file>]

with <> indicating obligatory input, and [] indicating non-obligatory input. The following command line options are available.

-f <input file> Process a BUFR or PFS input file with name input file.

AWDP detects if the input file is in BUFR format. If not, it attempts to read the input as PFS file. The BUFR input file should either have the ASCAT or the ERS format. The PFS file should contain 25 or 12.5 km level 1b data, not full resolution level 1b data.

<u>Example</u>: awdp -f ascat_20070426_test_250.11_bufr will process this file. The results will be written to a new BUFR file, see below in this section for the output file naming convention. It is possible to concatenate multiple BUFR input files into one using the Unix cat command, but PFS files must be processed one by one.

-nwpfl <file> Read a list of GRIB file names in the file named file.

The files in the list are read and the GRIB edition 1 or 2 data are used in the wind processing. The most convenient way to construct a file list is to use the Unix command ls -1 GRIB file pattern > file. If no GRIB data are used, only the land masking which is present in the level 1b beam information will be used. No ice screening will be performed (unless the -icemodel option is used). Ambiguity removal will be performed only if model winds are already present in the input BUFR file (i.e., in case of reprocessing of a level 2 file) or if the -armeth 1strank option is used (i.e., selection of the 1st rank wind solution). If level 2 data are reprocessed and no NWP data are read, the qual_sigma0 flag which was set in the initial processing is evaluated and it will be used to determine if a WVC contains suitable backscatter data for wind inversion.

Several options for the processing can be invoked.

```
-szffl <file> Read a list of full resolution PFS file names in the file named file.
The files in the list are read and the full resolution PFS data (SZF) are used to replace the 25-km/12.5-km beam data. This option is intended to produce a coastal wind product. The beam data (\sigma^0 values, incidence and azimuth angles) which are read from the BUFR or PFS level 1b input file, are replaced by average values of the data from the full resolution file which are located within a certain radius (typically 10 to 20 kilometers) from the WVC location. See section 3.5.3 for more information.
```

-stressparam Get stress-related parameters derived from GRIB files.

This option is intended for research activities. More information can be found in the Fortran code of AWDP.

-noinv Switch off inversion (default is switched on).

-icemodel <IM> Choose ice screening method to be used: 0 (default), 1 or 2.

The value 0 results in no ice screening, except when a GRIB file containing sea surface temperature is read. The value 1 invokes a simple (non-Bayesian) ice model which does not keep history of the water or ice state of each location. Value 2 invokes the Bayesian ice model which keeps the history of each location and uses this history to determine the sea or ice state of a WVC. The ice screening can be combined with the ice screening which is done in the GRIB collocation. In this case, the SST of the GRIB file will be used to assign a WVC as 'surely water' when the SST is above a certain value.

-noamb Switch off ambiguity removal (default is switched on). This option is useful if the selection of the scatterometer wind solution is left to the data assimilation procedure of a Numerical Weather Prediction model. In other words: the NWP model is fed with a number of solutions and their probability, and finds the best value when comparing with other data sources.

-nowrite Do not produce BUFR output (default is switched on).

-ignorellflags Ignore the setting of level 1b σ^0 related flags in BUFR input.

If this option is switched on, the value of the flags and quality indicators in the beam information, including the sigma0 usability and land fraction, is neglected.

-cmod <N> Choose CMOD version 4, 5, 55, 5n (default) or 6.

With this option, the user can choose between GMF version CMOD4, CMOD5, CMOD5.5 (CMOD5 + 0.5 m/s), CMOD5n (CMOD5 for neutral winds) or CMOD6. The GMF table is generated by the program and written to a binary file named c-vv2.dat in the current directory, if it does not yet exist. Alternatively, the user may specify a file name (including path) in the environment variable \$LUT_FILENAME_C_VV. If \$LUT_FILENAME_C_VV is present, it will be used to store the GMF. A second file with the same name and extension .zspace is also generated. Note: the old GMF files need to be removed if new files need to be generated, i.e., if a different GMF version is requested.

 -calval Perform σ⁰ calibration. A calibration of the σ⁰. values is performed. See [Verspeek,, Stoffelen, Verhoef and Portablla, 2012] for more details. Calibration coefficients are applied dependent on the satellite (Metop A or B) and the level 1 data processing version.
 -mss Use the Multiple Solution Scheme for Ambiguity Removal.

-mss Use the Multiple Solution Scheme for Ambiguity Removal. If the Multiple Solution Scheme (MSS) is switched on, AWDP internally

works with 144 different solutions for the wind vector. If MSS is switched off, AWDP calculates two solutions at most. MSS is switched off as default.

-armeth <meth> Choose ambiguity removal method. Valid methods are: 1strank - the wind solution with the lowest distance to the GMF (residual) is selected, bgclosest - the wind solution closest to the background model wind is selected, prescat - see section 6.5, 2dvar - 2DVAR, see section 6.4. The default is 2dvar.

-par, -ana, -tc, -varqc, -ocf, -research, -orpm Various options intended for research activities. More information can be found in the Fortran code of AWDP and genscat.

-binof <file> Write selected data of each WVC to a binary output file. Data are written to a binary file <file>. This option is intended for research activities. More information on the file format can be found in the Fortran code of AWDP.

-writeall Write all data to BUFR output, including level 2 input data. In the normal near-real time processing, a mixture of level 1b and (recent) level 2 data is fed into AWDP in order to provide more data, which is beneficial for ambiguity removal. Only those data rows which were level 1b input, are written to the level 2 output file. This option overrides this behaviour and writes all rows to the output file.

-handleall Perform NWP collocation, inversion, ambiguity removal and output writing in all WVCs.

By default, these steps are done only for WVCs which are level 1b input, see the description at the -writeall option. This option is useful for reprocessing level 2 data.

-nws <N> Write N wind solutions in BUFR output (default 4).

The number of wind solutions to be written into the ASCAT BUFR format is flexible due to the use of the so-called delayed replication and can be chosen between 1 (providing only the selected wind solution) and 144 (providing all wind solutions in MSS processing).

-subc <SC> Set id of sub-centre in each WVC of the BUFR output to SC. By default it is copied from input.

- -mon Switch on the monitoring function. The monitoring results are written in an ASCII file with the name monitoring_report.txt. By default, no monitoring file is produced.
- -verbosity <L> Set the verbosity level to L (default is 0). If the verbosity level is -1 or smaller, no output is written to the standard output except error messages. If the verbosity level equals 0 only some top level processing information is written to output. If the verbosity level is 1

or greater, also additional information is given.

The normal mode of operation of AWDP is wind processing, i.e., a BUFR or PFS file is read and the various processing steps are performed. Note that by default, AWDP does not recalculate data that are already present in the input. For example, if a WVC already contains model winds then the GRIB collocation will not be done for this WVC; if a WVC already contains wind solutions then the wind inversion will not be performed. This behaviour is desired when near-real time processing is performed and a mixture of level 1b and level 2 files is fed into AWDP. If one wants to perform reprocessing of level 2 files, the behaviour of AWDP can be changed by the command line options, e.g. the -handleall option.

Besides the wind processing, some other modes of operation are available. If one of the modes is invoked, AWDP internally sets some of the options in order to obtain the desired result. Note that these modes are always used in combination with the -f <input file> option.

-mononly	Write the monitoring file without any processing.
-properties	Write some properties of the last row of the input file. The acquisition date and time and the sub-centre id are written to a small ASCII output file properties.txt.
-writeonly	Write all data to BUFR output without processing. This mode is useful to copy an input file to BUFR output without processing.

Running the command awdp without any command line options will display a list of all available command line options with a short explanation on the console. Running the command awdp with an illegal option will produce the same output, but preceded by an error message.

The output will be written into a BUFR file with the name

```
INSTR_YYYYMMDD_HHMMSS_SAT_ORBIT_srv_o_SMPL(_CONT).l2_bufr,
```

where

- INSTR is the instrument, ascat or scatt.
- YYYYMMDD_HHMMSS is the acquisition date and time (UTC) of the first data in the file.
- SAT is the satellite (6 characters), ers1__, ers2__, metopa or metopb.
- ORBIT is the orbit number (5 digits) of the first data in the file, 00000 for ERS data.
- SMPL is the WVC sampling (cell spacing), 250 for 25 km and 125 for 12.5 km.
- _CONT (contents) is omitted if the data contains both wind and soil moisture data. Otherwise it is set to _ovw (Ocean Vector Winds) or _ssm.

Example: ascat_20070426_095102_metopa_02681_srv_o_250_ovw.l2_bufr

2.5 Scripts

Directory awdp/execs contains a Bourne shell script awdp_run for running awdp with the correct environment variables. The script can be invoked with all valid command line options for awdp. In the same directory, there is also a script awdp_gui.py available. This script provides a

convenient graphical user interface and builds and runs an AWDP command line depending on settings of available radio buttons, check boxes et cetera. This script requires Python to be installed on your system. It may be necessary to change some of the environment variables set in the top part of the script.

2.6 Test data and test programs

Directory awdp/tests contains two BUFR files for testing the AWDP executable.. File ascat_20070426_test_250.ll_bufr contains ASCAT level 1b data from 26 April 2007, 9:51 to 10:29 UTC with 25 km cell spacing. The same data, but on 12.5 km cell spacing is available in file ascat_20070426_test_125.ll_bufr. The files ECMWF*.grib contain the necessary NWP data (SST, land-sea mask and wind forecasts) to perform the NWP collocation step.

The user can test the proper functioning of AWDP using the files in the awdp/tests directory. To do this, first create a small file containing a list of NWP files:

ls -1 ECMWF_200704260000_0* > nwpflist

Then run AWDP on 25-km and 12.5-km cell spacing:

```
../execs/awdp_run -f ascat_20070426_test_250.l1_bufr -mon -calval
-nwpfl nwpflist
```

```
../execs/awdp_run -f ascat_20070426_test_125.l1_bufr -mon -calval
-nwpfl nwpflist
```

The result should be two ASCAT level 2 files in BUFR format, called ascat_20070426_095102_metopa_02681_srv_o_250_ovw.l2_bufr and ascat_20070426_095100_metopa_02681_srv_o_125_ovw.l2_bufr, respectively.

Figure 2.3 shows the global coverage of the test run on 25 km. The colours indicate the magnitude of the wind speed as indicated by the legend. The result on 12.5 km should be very similar to this.

Directory awdp/tests also contains an ERS BUFR file in ESA format, called scatt_20070426_test_250.ll_bufr in ESA BUFR format. The data are from the same date as the ASCAT data in this directory and they can be processed using the same ECMWF files:

../execs/awdp_run -f scatt_20070426_test_250.11_bufr - mon -nwpfl
nwpflist

The result should be an output file in ASCAT BUFR format, called scatt_20070426_063627_ers2__00000_srv_0_250_ovw.l2_bufr

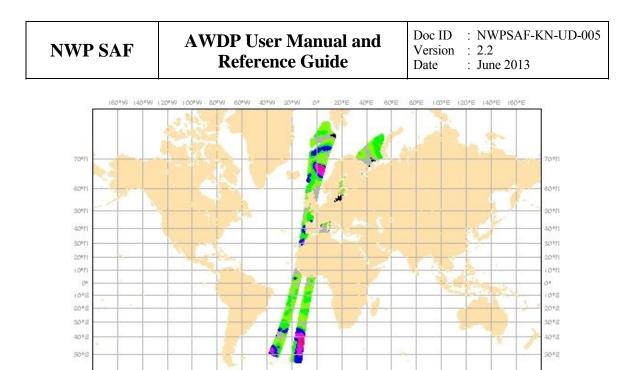

Figure 2.3 Global coverage of the test run. Wind speed results for the 25 km product are shown.

012

Directory genscat/support/bufr contains a test program named test_modules. It is invoked by the genscat make system to construct the BUFR tables required by AWDP, but it can also be used to test the genscat BUFR module. The program is used as follows:

test_modules [BUFRinput]

80*2

70*2

where BUFRinput is the BUFR input file.

If omitted, the program uses as default input the file testreading.bufr in directory genscat/support/bufr. The output is written to a BUFR file named testwriting.bufr. The directory also contains a shell script named run_test_modules that sets the environment variables required and executes the program. Further information can be found in the comment lines of the source code of test_modules.

Directory genscat/support/grib contains test programs named test_read_GRIB1, test_read_GRIB2 and test_read_GRIB3. The programs can be run from the command line and read in the GRIB file testfile.grib in directory genscat/support/grib. Some properties of this file are written to ASCII output files. Note that the environment variable \$GRIB_DEFINITION_PATH needs to be set to directory (...)/genscat/support/grib/definitions.

Subdirectories Compiler_Features, convert, ErrorHandler, singletonfft, file, BFGS, num, sort and datetime of genscat/support contain test programs for the module in that subdirectory. The test programs write their result to the standard output. In some cases, a copy of the output is contained in the .output files for comparison. Table 2.6 gives an overview of the genscat test programs.

Subdirectory	Program name	Output file	Remarks
bufr	test_modules	testwriting.bufr	Part of make system
grib	test_read_GRIB*	several	GRIB handling
Compiler_Features	TestCompiler_Features	-	Command line handling
convert	test_convert	test_convert.output	Wind speed conversion
ErrorHandler	TestErrorHandler	-	Error handling
singletonfft	TestSingleton	-	Fast Fourier Transform
file	TestLunManager	TestLunManager.output	File management
BFGS	Test_BFGS	-	Minimization
num	test_numerics	test_numerics.output	Numerical issues
pfs	test_pfs_ascat	-	Read PFS file
sort	SortModTest	SortModTest.output	Array sorting
datetime	TestDateTimeMod	TestDateTimeMod.output	Date and time conversion

Table 2.6Test programs in genscat/support.

2.7 Documentation

Directory awdp/doc contains documentation on AWDP, including this document. Further information can be found in the readme text files, and in the comments in scripts, Makefiles and source code.

Chapter 3

AWDP product specification

3.1 Purpose of program AWDP

The ASCAT Wind Data Processor (AWDP) program has been developed to fully exploit σ^0 data from the ASCAT scatterometer instrument on the Metop satellites or the AMI scatterometer instrument on the European Remote Sensing (ERS) satellites, to generate surface winds. AWDP may be used for real-time data processing. The main application of AWDP is to form the core of an Observation Operator for ASCAT scatterometer data within an operational Numerical Weather Prediction System.

Program AWDP is also a level 2 data processor. It reads data from the EUMETSAT level 1b ASCAT BUFR or PFS product or from the ESA ERS scatterometer BUFR product. AWDP applies algorithms for inversion, quality control, and Ambiguity Removal at various spatial resolutions. These methods are mainly developed and published by KNMI. The output of AWDP is a BUFR file in ASCAT BUFR format.

3.2 Output specification

The wind vectors generated by AWDP represent the instantaneous mean surface wind at 10 m anemometer height in a 2D array of Wind Vector Cells (WVCs) with specified size ($25 \times 25 \text{ km}^2$ or $12.5 \times 12.5 \text{ km}^2$, depending on the cell spacing of the input product). These WVCs are part of the ground swath of the instrument.

In conventional mode, the wind output for every WVC consists of up to 4 ambiguities (wind vector alternatives, with varying probabilities). The selected wind vector is indicated by a selection index. For every WVC additional parameters are stored. These are e.g.: latitude, longitude, time information, orbit and node numbers, background wind vector, cell quality flag, and information on the scatterometer beams including σ^0 and K_p data. The output file is structured according to the same conventions as the ASCAT level 1b input, also if ERS data are processed.

The ASCAT BUFR format consist of three main sections: one section containing level 1b information which is copied from the input data, one section containing Surface Soil Moisture (SSM) level 2 information, which is also copied from the input, and one section containing level 2 wind data, which is calculated in AWDP. The ASCAT BUFR data descriptors are listed in Appendix C.

3.3 Input specification

Input of AWDP is the ASCAT level 1b BUFR or PFS Data Product. These products are created by EUMETSAT; see [*WMO*, 2007] and [*Figa-Saldaña and Wilson*, 2005]. Alternatively, the ERS scatterometer wind product in BUFR can be used as input; see [*UK Met Office*, 2001].

It is also possible to reprocess level 2 ASCAT or ERS data in ASCAT BUFR format, and treat them as if they are level 1b data. To achieve this, some command line options need to be set; see section 2.4.

Apart from the scatterometer data, GRIB files containing NWP output with global coverage are necessary for the wind processing. At least three wind forecasts with forecast time intervals of 3 hours are necessary to perform interpolation with respect to time and location. Apart from this, GRIB fields of Sea Surface Temperature and Land Sea Mask are necessary for land and ice masking.

3.4 System requirements

Table 3.1 shows the platform and compiler combinations for which AWDP has been tested. However, the program is designed to run on any Unix (Linux) based computer platform with a Fortran compiler and a C compiler. The equivalent of a modern personal computer will suffice to provide a timely NRT wind product. AWDP requires about 100-150 MB disk space when installed and compiled.

Platform	Fortran compiler	C compiler
Fedora Linux work station	Portland pgf90	GNU gcc
	GNU g95	
	GNU gfortran	
SunOS Unix	Sun Fortran	Sun C
SGI Altix	Intel Fortran compiler	Intel C compiler
Windows XP PC with Cygwin	GNU g95	GNU gcc

Table 3.1 Platform and compiler combinations for which AWDP has been tested.

AWDP may also run in other environments, provided that the environment variables discussed in section 2.2 are set to the proper values, and that the BUFR library is properly installed. For Windows a Unix emulator like Cygwin is needed.

3.5 Details of functionality

3.5.1 BUFR IO and coding

Data sets of near-real time meteorological observations are generally coded in the Binary Universal Form for Representation (BUFR). BUFR is a machine independent data representation system (but it contains binary data, so care must be taken in reading and writing these data under different operating systems). A BUFR message (record) contains observational data of any sort in a self-descriptive manner. The description includes the parameter identification and its unit, decimal, and scaling specifications. The actual data are in binary code. The meta data are stored in

BUFR tables. These tables are therefore essential to decode and encode the data.

BUFR tables are issued by the various meteorological centres. The largest part of the data descriptors specified in the BUFR tables follows the official BUFR descriptor standards maintained by the World Meteorological Organization (WMO, <u>http://www.wmo.int/</u>). However, for their different observational products meteorological centres do locally introduce additional descriptors in their BUFR tables.

Appendix C contains a listing of the data descriptors of the BUFR data input and the BUFR data output of the AWDP program in the ASCAT BUFR product format. For more details on BUFR, the reader is referred to [*Dragosavac*, 1994].

ECMWF maintains a library of routines for reading (writing) and decoding (encoding) the binary BUFR messages. This library forms the basis of the genscat BUFR module and hence the AWDP program BUFR interface, see Chapter 8.

3.5.2 Product resolution

An important feature of the AWDP program is that it may produce a level 2 wind product on different resolutions. The resolution of the level 2 wind product is the same as that of the level 1b input product. ASCAT data are available in two different resolutions: 50 km resolution with 25 km cell spacing (also known as the ASCAT operational product, SZO) and 25 km resolution with 12.5 km cell spacing (also known as the ASCAT research product, SZR).

3.5.3 Use of full resolution data

AWDP offers the possibility to replace the backscatter values in the level 1b product by box averaged σ^0 data that are acquired using the full resolution ASCAT level 1 data (SZF). The beam data (σ^0 values, incidence and azimuth angles) which are read from the BUFR or PFS level 1b input file, are replaced by average values of the data from the full resolution file which are located within a certain radius (typically 10 to 20 kilometers) from the WVC location. In this way, a coastal product can be created. See [*Verhoef et. al.*, 2012] for more information on how the box averaged σ^0 data are composed. It is important to notice that the full resolution data which are fed into AWDP (using the -szffl option) must span a time starting at least 150 seconds before the first data in the level 1b WVCs and ending no less than 150 seconds after the last data in the level 1b WVCs.

AWDP needs a high-resolution land-sea mask in order to determine if a full resolution backscatter measurement is over land or sea. This information is used in coastal areas to skip backscatter data over land and to use only backscatter data over sea in the averaging of full resolution data. The high resolution land-sea mask should be available in GRIB format and should have a resolution of approximately 15 km or better. The file containing the land-sea mask should be present in the list of GRIB files supplied with the -nwpfl command line option (see section 2.4).

3.5.4 WVC triplet completion and row merging

AWDP sorts the WVC rows in the input file by their acquisition date and time and merges WVC information if duplicate rows occur. The duplicate information is considered and the output will contain as much useful information as is available in the input WVCs. This is especially useful if

direct readout data from different ground stations is processed. Sometimes a WVC from one ground station contains only fore beam information, whereas the corresponding WVC from a second ground station contains only the mid and aft beam information. AWDP will combine the information and it will process and write one WVC containing all three beams.

3.5.5 Quality control

The quality of every WVC is controlled. Before processing the beam data, checks are done on the completeness and usability of the σ^0 data. After the wind inversion step, the distance of the first rank wind solutions to the GMF is considered. If this value is too large, the wind solutions are flagged. The K_p values are also considered. If one of the three beam K_p values is above a threshold which is wind speed dependent, the wind information is flagged [*Stoffelen*, 1998].

3.5.6 Inversion

In the inversion step of wind retrieval, the radar backscatter observations in terms of the Normalized Radar Cross Sections (σ^{0} 's) are converted into a set of ambiguous wind vector solutions. In fact, a Geophysical Model Function (GMF) is used to map a wind vector (specified in term of wind speed and wind direction) to a σ^{0} value. The GMF depends not only on wind speed and wind direction but also on the measurement geometry (relative azimuth and incidence angle) and beam parameters (frequency and polarization). Currently, the CMOD5 GMF which was developed for ERS is in use, see [*Hersbach, Stoffelen and de Haan*, 2007], but improvements are under study.

The AWDP program also includes the Multiple Solution Scheme (MSS). In MSS mode, a large number of wind vector solutions is produced, typically 144. The wind vector solutions are ranked according to their probability based on the MLE and constitute the full wind vector probability density function. Subsequently, the 2DVAR Ambiguity Removal method, see, e.g., section 3.5.8, is applied with a much larger set of wind vector solutions. The output BUFR format can accommodate any number of wind solutions due to the use of the so-called delayed descriptor replication. Details on the KNMI inversion approach can be found in [*Portabella*, 2002]. For SeaWinds, MSS compares better to an independent NWP model reference and buoys than conventional two or four-solution schemes [*Portabella and Stoffelen*, 2004; *Vogelzang et al.*, 2008], but for ERS and ASCAT this needs to be investigated further.

Technical information on the KNMI inversion approach can be found in Chapter 5.

3.5.7 Ice screening

A Bayesian sea ice detection algorithm was developed for ASCAT [*Belmonte et al.*, 2012] and this algorithm is implemented in AWDP. It is based on the probabilistic distances to ocean and sea ice geophysical model functions. When a combination of backscatter measurements is close to the wind GMF, the probability that the WVC is covered with water is high. On the other hand, when the measurement is close to the sea ice GMF, the probability that the WVC contains ice is high. Each satellite overpass over the poles will yield new measurements which contribute to an ice map containing the ice probabilities.

3.5.8 Ambiguity Removal

The Ambiguity Removal (AR) step of the wind retrieval is the selection of the most probable surface wind vector among the available wind vector solutions, the so-called ambiguities. Various methods have been developed for AR. More information on Ambiguity Removal is given in Chapter 6. The default method implemented in AWDP is the KNMI 2DVAR AR scheme. A description of its implementation can be found in section 6.4. The Multiple Solution Scheme (MSS) offers the possibility to postpone AR to the NWP step in order to treat all information from models and measurements in the same manner. Further details on the algorithms and their validation can be found in the reports [*de Vries and Stoffelen*, 2000; *de Vries, Stoffelen and Beysens*, 2005].

The performance of 2DVAR with meteorological balance constraints was tested and optimized for ERS data. It was found to be superior to other schemes.

3.5.9 Monitoring

For the automatic ingestion of observations into their NWP systems, meteorological centres require quality checks on the NRT products. For the ASCAT wind product a monitor flag is under development, analogous to the one developed for the SeaWinds Wind Product. This flag indicates that several measures on the level of corruption of the output BUFR files are above a specified threshold. Onset of the flag indicates that the input should be rejected for ingestion by the NWP system. Details on the monitor developed can be found in the NWP SAF document [*de Vries, Stoffelen and Beysens*, 2005].

3.6 Details of performance

AWDP is delivered with two example BUFR input files containing data from 26 April 2007. They are named ascat_20070426_test_250.ll_bufr (25 km cell spacing) and ascat_20070426_test_125.ll_bufr (12.5 km cell spacing) and contain approximately half an orbit of data. Moreover, a set of ECMWF GRIB files containing the necessary NWP output is supplied. Table 3.2 gives the approximate times needed for processing these files under various options on a personal workstation with a 2.66 GHz Pentium 4 processor under Linux using the GNU g95 Fortran compiler.

Cell spacing (m)	MSS?	Inversion (seconds)	AR (seconds)	BUFR IO (seconds)	GRIB IO (seconds)	Total (seconds)
25000	No	33	8	3	1	46
12500	No	132	16	8	3	160
12500	Yes	156	91	8	3	263

 Table 3.2 Approximate times needed by AWDP to process example BUFR files under various input resolutions and options.

As can be seen from table 3.2, the use of MSS results in slightly larger processing times needed for inversion and in much larger processing times needed for AR. The computation time, of course, increases with increasing resolution.

The choice of platform, compiler and compiler settings will result in a large variation in the

Ν	W	Έ	S	A	F
ΤN			D.		.

processing times. Using the Portland pgf90 compiler rather than the GNU g95 compiler in the examples in table 3.2 will result in processing times that are 25% to 50% smaller.

Chapter 4

Program Design

In this chapter, the design of the AWDP program is described in detail. Readers to whom only a summary will suffice are referred to the Top Level Design (TLD) in section 4.1. Readers who really want to know the very detail should not only read the complete chapter, but also the documentation within the code.

4.1 Top Level Design

4.1.1 Main program

The main program, AWDP, (file awdp in the awdp/src directory) is a Unix (Linux) executable which processes ASCAT BUFR or PFS or ERS BUFR input files. The main output consists of BUFR files. The output BUFR messages are always in the ASCAT BUFR format, for a list of descriptors see appendix C. The user may provide arguments and parameters according to Unix command line standards. The purpose of the different options is described in the User Manual (Chapter 2).

When executed, the AWDP program logs information on the standard output. The detail of this information may be set with the verbosity flag. The baseline of processing is described in Figure 4.1, but note that not all of these steps are always invoked. Some of them will be skipped, depending on the command line options. A more detailed representation of the AWDP structure is given in Appendices A and B.

The first step is to process the arguments given at the command line using the genscat *Compiler_Features* module. Next, the AWDP program reads the input file specified in the arguments. The BUFR messages or PFS records are read and mapped onto the AWDP data structure, see subsection 4.1.3. As part of the pre-processing a similar AWDP data structure is created for the output. Subsequently, the input data are sorted with respect to data acquisition time, duplicate rows are merged and the output data structure is filled with level 1b (σ^0 related) data. Then, the NWP GRIB data (wind forecasts, land-sea mask and sea surface temperature) are read and the data are collocated with the Wind Vector Cells. The next steps are the inversion and the ambiguity removal. These steps are performed on the output data. The program ends with the post-processing step (which includes some conversions and the monitoring) and the mapping of the output data structure onto BUFR messages of the BUFR output file. The different stages in the processing correspond directly to specific modules of the code. These modules form the process

layer, see section 4.3.

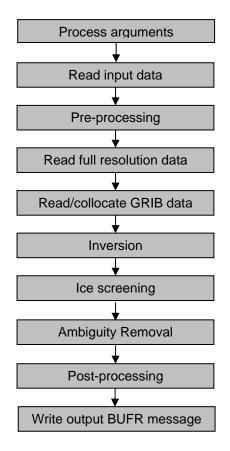

Figure 4.1 Baseline of the ASCAT Wind Data Processor

4.1.2 Layered model structure

AWDP is a Fortran 90 program consisting of several Fortran 90 modules which are linked after their individual compilation. The AWPD program is set up from two layers of software modules. The purpose of the layer structure is to divide the code into generic scatterometer processing software and ASCAT specific software. Details on the individual modules can be found in sections 4.2 and 4.3.

The first layer (the process layer) consists of modules which serve the main steps of the process.

Module name	Tasks	Comments
awdp_data	Definition of data structures	
awdp_bufr	BUFR file handling	Interface to genscat/support/bufr
awdp_pfs	PFS file handling	Interface to genscat/support/pfs
awdp_prepost	Sorting of input	Duplicate rows are merged
	Quality control	Usability of input data is determined
	Post processing	Setting of flags
	Monitoring	
	Clean up	Deallocation of used memory
awdp_grib	GRIB file handling	Interface to genscat/support/grib
	Collocation of GRIB data	NWP data are interpolated w.r.t. time and location

Module name	Tasks	Comments
awdp_inversion	Inversion	Interface to genscat/inversion
awdp_ambrem	Ambiguity Removal	Interface to genscat/ambrem
_awdp_icemodel	Ice screening	Interface to genscat/icemodel

Table 4.1	AWDP process modul	es.
-----------	--------------------	-----

Each module contains code for performing one or more of the specific tasks. These tasks are briefly described in table 4.1. A more elaborate description is given in section 4.3. The first module listed, *awdp_data* is a general support module. This module is used by the other modules of the process layer for the inclusion of definitions of the data structures and the support routines.

The second module layer is the genscat layer. The genscat module classes (i.e., groups of modules) used in the AWDP program are listed in table 4.2. The genscat package is a set of generic modules which can be used to assemble processors as well as pre, and post-processing tools for different scatterometer instruments available to the user community. A short description of the main (interface) modules is given in section 4.2. The most important classes of modules are related to the inversion processing step (Chapter 5), the Ambiguity Removal step (Chapter 6), the BUFR file handling (Chapter 8), and the GRIB file handling (Chapter 9). The genscat modules are located in subdirectory genscat.

In addition, genscat contains a large support class to convert and transform meteorological, geographical, and time data, to handle file access and error messages, sorting, and to perform more complex numerical calculations on minimization and Fourier transformation. Many routines are co-developed for ERS, ASCAT and SeaWinds data processing.

Module class	Tasks	Description
Ambrem	Ambiguity Removal	2DVAR and other schemes, see Chapter 6
Inversion	Wind retrieval	Inversion in one cell, see Chapter 5
IceModel	Ice screening	Uses ice line and wind cone for ice discrimination
Support	BUFR support	BufrMod, based on ECMWF library
	PFS support	Reading of PFS files
	GRIB support	gribio module, based on ECMWF library
	FFT, minimization	Support for 2DVAR
	Error handling	Print error messages
	File handling	Finding, opening and closing free file units
	Conversion	Conversion of meteorological quantities
	Sorting	Sorting of ambiguities to their probability
	Date and time	General purpose

Table 4.2genscat module classes.

4.1.3 Data Structure

Along track, the ASCAT swath is divided into rows. Within a row (across track), the ASCAT orbit is divided into cells, also called Wind Vector Cells (WVCs) or nodes. This division in rows and cells forms the basis of the main data structures within the AWDP package. In fact, both the input and the output structure are one dimensional arrays of the row data structure, *row_type*. These arrays represent just a part of the swath. Reading and writing (decoding and encoding) ASCAT BUFR files corresponds to the mapping of a BUFR message to an instance of the *row type* and

vice versa.

The main constituent of the *row_type* is the cell data structure, *cell_type*, see figure 4.2. Since most of the processing is done on a cell-by-cell basis the *cell_type* is the pivot data structure of the processor.

row_type			
	cell_type		
		beam_type	
		ambiguity_type	

Figure 4.2 Schematic representation of the nested data definitions in the *row_type* data structure.

The σ^0 related level 1b data of a cell are stored in a data structure called *beam_type*. Every cell contains three instances of the *beam_type*, corresponding to the fore, middle and aft beams.

A cell may also contain an array of instances of the *ambiguity_type* data structure. This array stores the results of a successful wind retrieval step, the wind ambiguities (level 2 data). Details of all the data structures and methods working on them are described in the next sections.

4.1.4 Quality flagging and error handling

Important aspects of the data processing are to check the validity of the data and to check the data quality. In the AWDP program two flags are set for every WVC, see table 4.3. The flags themselves do not address a single aspect of the data, but the flags are composed of several bits each addressing a specific aspect of the data. A bit is set to 0 (1) in case the data is valid (not valid) with respect to the corresponding aspect. In order to enhance the readability of the code, each flag is translated to a data type consisting of only booleans (false = valid, true = invalid). On input and output these data types are converted to integer values by *set* and *get* routines.

Flag	Tasks	Description
wvc_quality	Quality checking	In BUFR output
process_flag	Range checking	Not in BUFR output

Table 4.3 Flags for every WVC (attributes of *cell_type*).

Apart from the flags on WVC level, also the beams contain quality indicators. Most of them are implemented as real values ranging from 0 to 1, where 0 stands for good quality and 1 for degraded quality. See section 4.3.1 for more information on this.

4.1.5 Verbosity

Every routine in a module may produce some data and statements for the log of the processor. To

control the size the log, several modules contain parameters for the level of verbosity. The verbosity of the AWDP program may be controlled by the verbosity command line option -verbosity. In general, there are three levels of verbosity specified:

- \leq -1: be as quiet as possible;
- 0: only report top level processing information;
- \geq 1: report additional information.

Of course, errors are logged in any case. Table 4.4 gives a (incomplete) list of verbosity parameters. They are not all set by the command line option as some of them serve testing and debugging purposes.

Module	Verbosity parameter
Ambrem2Dvar	TDVverbosity
AmbremBGclosest	BGverbosity
BatchMod	BatchVerbosity
Ambrem	AmbremVerbosity
awdp bufr	BufrVerbosity
awdp grib	GribVerbosity
awdp icemodel	dbgLevel

4.2 Module design for genscat layer

4.2.1 Module *inversion*

The module *inversion* contains the *genscat* inversion code. Module *post-inversion* contains some routines specific for ERS and ASCAT inversion and quality control. The modules are located in subdirectory genscat/inversion. Details of this module are described in Chapter 5. In the AWDP program, the inversion module is only used in the *awdp_inversion* module, see section 4.3.6.

4.2.2 Module *ambrem*

The module *ambrem* is the main module of the genscat Ambiguity Removal code. It is located in subdirectory genscat/ambrem. Details of this module are described in Chapter 6. In the AWDP program, the *ambrem* module is only used in the *awdp_ambrem* module, see section 4.3.7.

4.2.3 Module *icemodel*

The module *icemodel* contains the *genscat* ice screening code. It is located in subdirectory genscat/icemodel. In the AWDP program, the *icemodel* module is only used in the *awdp_icemodel* module, see section 4.3.8.

4.2.4 Module *Bufrmod*

Genscat contains several support modules. In particular, the BufrMod module is the Fortran 90

wrapper around the BUFR library used for BUFR input and output. It is located in subdirectory genscat/support/bufr. Details of this module are described in Chapter 8. In the AWDP program, the *BufrMod* module is only used in the *awdp_bufr* module, see subsection 4.3.2.

4.2.5 Module gribio_module

The *gribio_module* module is the Fortran 90 wrapper around the GRIB library used for GRIB input and collocation of the NWP data with the scatterometer data. It is located in subdirectory genscat/support/grib. Details of this module are described in Chapter 9. In the AWDP program, the *gribio_module* module is used in the *awdp_grib* and *awdp_pfs* modules, see subsection 4.3.5.

4.2.6 Support modules

Subdirectory genscat/support contains more support modules besides *Bufrmod* and *gribio_module*. The KNMI 2DVAR Ambiguity Removal method requires minimization of a cost function and numerical Fourier transformation. These routines are located in subdirectories BFGS and singletonfft, respectively, and are discussed in more detail in section 6.4.

Subdirectory Compiler_Features contains module *Compiler_Features* for handling some compiler specific issues, mainly with respect to command line argument handling. The Makefile in this directory compiles on of the available source files, depending on the Fortran compiler used.

Subdirectory convert contains module *convert* for the conversion of meteorological and geographical quantities, e.g. the conversion of wind speed and direction into u and v components and vice versa.

Subdirectory datetime contains module *DateTimeMod* for date and time conversions. AWDP only uses routines *GetElapsedSystemTime* (for calculating the running time of the various processing steps), and *julian2ymd* and *ymd2julian* (for conversion between Julian day number and day, month and year). Module *DateTimeMod* needs modules *ErrorHandler* and *numerics*.

Subdirectory ErrorHandler contains module *ErrorHandler* for error management. This module is needed by module *DateTimeMod*.

Subdirectory file contains module *LunManager* for finding, opening and closing free logical units in Fortran. AWDP uses only routines *get_lun* and *free_lun* for opening and closing of a logical unit, respectively.

Subdirectory num contains module *numerics* for defining data types and handling missing values, for instance in the BUFR library. This module is needed by many other modules.

Subdirectory pfs contains module pfs_ascat for opening, reading and closing of files in PFS format.

Subdirectory sort, finally, contains module *SortMod* for sorting the rows according to their acquisition date and time, or the wind vector solutions according to their probability.

4.3 Module design for process layer

The process layer consists of the modules *awdp_data*, *awdp_bufr*, *awdp_pfs*, *awdp_prepost*, *awdp_grib*, *awdp_inversion*, *awdp_icemodel* and *awdp_ambrem*. The routines present in these modules are described in the next sections.

4.3.1 Module *awdp_data*

The module *awdp_data* contains all the important data types relevant for the processing. Elementary data types are introduced for the most basic data structures of the processing. These are e.g. *wind_type* and *time_type*. Using these data types (and of course the standard types as integer, real etc.), more complex (composed) data types are derived. Examples are *beam_type*, *ambiguity_type*, *cell_type*, and *row_type*. A complete description of all types is given below. The attributes of all these types have intentionally self-documenting names.

Ambiguity data: The *ambiguity_type* data type contains information on an individual ambiguity (wind vector solution). The attributes are listed in table 4.5. The routine *init_ambiguity()* sets all ambiguity data to missing. The routine *print_ambiguity()* may be used to print all ambiguity data.

Attribute	Туре	Description
wind	wind_type	Wind vector solution
prob	real	Probability of wind vector solution
conedistance	real	Distance of solution to the GMF

Table 4.5	Ambiguity data structure.
-----------	---------------------------

Beam data: Every WVC contains three beams. The information of every beam is stored in the data type *beam_type*. The attributes are listed in table 4.6. Most of the attributes are explained in detail in [*Wilson, Figa-Saldaña and O'Clerigh,* 2004]. The routine *init_beam()* sets all beam data to missing and the routine *test_beam* checks if the data in the beam are within valid ranges. The routine *print_beam()* may be used to print all beam data.

Attribute	Туре	Description
identifier	integer	Beam number: $1 = $ fore, $2 = $ mid, $3 = $ aft
incidence	real	Incidence angle (degrees, 0 is vertical, 90 is horizontal)
azimuth	real	Radar look angle (degrees, counted clockwise from the south)
sigma0	real	Radar backscatter (σ^0) in dB
noise_val	real	Noise value in %
kp_estim_qual	kp_estim_qual_type	Flag related to the quality of the Kp estimate
s0_usability	integer	Usability of σ^0 : 0 = good, 1 = usable, 2 = bad
synt_data_quantity	real	Amount of synthetic data in $\sigma^0(01)$
synt_data_quality	real	Quality of used synthetic data in $\sigma^0(01)$
orbit_quality	real	Satellite orbit and attitude quality (01)
solar_reflec	real	Solar array reflection contamination in $\sigma^0(01)$
telemetry	real	Telemetry quality (01)
extrapol_ref_pres	real	Presence of extrapolated reference functions (01)
land_frac	real	Land fraction in $\sigma^0(01)$

Cell Data: The *cell_type* data type is a key data type in the AWDP program, because many processing steps are done on a cell by cell basis. The attributes are listed in table 4.7. The routine *init_cell()* sets the cell data to missing values. Also the flags are set to missing. The routine *test_cell()* tests the validity of data. This routine sets the cell process flag. The routine *print_cell()* may be used to print the cell data.

Attribute	Туре	Description
centre_id	integer	Identification of originating/generating centre
sub_centre_id	integer	Identification of originating/generating sub-centre
software_id_l1b	integer	Software identification of level 1 processor
satellite id	integer	Satellite identifier
sat instruments	integer	Satellite instrument identifier
sat motion	real	Direction of motion of satellite
time	time type	Date and time of data acquisition
lat	real	Latitude of WVC
lon	real	Longitude of WVC
pixel size hor	real	Distance between WVCs (meters)
orbit nr	integer	Orbit number
node nr	integer	Across track cell number
height atmosphere	real	Height of atmosphere used
loss unit lenght	real	Loss per unit length of atmosphere
beam_collocation	beam_collocation_type	Beam collocation flag Beam data
<i>beam (3)</i>	beam_type	
full_res	full_res_type	Averaged full resolution data
software_id_sm	integer	Soil moisture information
database_id	integer	Soil moisture information
surface_sm	real	Soil moisture information
surface_sm_err	real	Soil moisture information
sigma0_40	real	Soil moisture information
sigma0_40_err	real	Soil moisture information
slope_40	real	Soil moisture information
slope_40_err	real	Soil moisture information
sm_sensitivity	real	Soil moisture information
dry backscatter	real	Soil moisture information
wet backscatter	real	Soil moisture information
mean surface sm	real	Soil moisture information
rain fall detect	real	Soil moisture information
sm corr flag	integer	Soil moisture information
sm proc flag	integer	Soil moisture information
sm quality	real	Soil moisture information
snow cov frac	real	Soil moisture information
froz land frac	real	Soil moisture information
inund_wet_frac	real	Soil moisture information
topo complexity	real	Soil moisture information
		Software identification of level 2 wind processor
software_id_wind	integer	
generating_app	integer	Generating application of model information
model_wind	wind_type	Model wind used for Ambiguity Removal
ICC DROD		Duch chiliter of ico
ice_prob	real	Probability of ice
ice_age	real	Ice age A-parameter
ice_age wvc_quality	real wvc_quality_type	Ice age A-parameter WVC quality flag
ice_age wvc_quality num_ambigs	real wvc_quality_type integer	Ice age A-parameter WVC quality flag Number of ambiguities present in WVC
ice_age wvc_quality	real wvc_quality_type	Ice age A-parameter WVC quality flag

Attribute	Туре	Description
ambig (0144)	ambiguity_type	Array of wind ambiguities
ice	icemodel_type	Ice information
stress_param	nwp_stress_param_type	Wind stress information
process flag	process flag type	Processing flag
level_of_input	integer	Level of input data (1 or 2)

Table 4.7Cell data structure.

All soil moisture information is read from the input BUFR file into the cell data structure and not used within the program. It is written to the output BUFR file at the end of the processing.

Full resolution data: The *full_res_type* contains average full resolution data, read from a PFS file, which are used to replace the 25-km or 12.5-km beam data. The attributes are listed in table 4.8. The routine *init_full_res()* sets the full resolution averaged data to zero. The routine *print_full_res()* may be used to print the full resolution data.

Attribute	Туре	Description
count_tot	integer	Number of full res measurements used
lat	real	Mean value of full res lats
lon	real	Mean value of full res lons
count_fore	integer	Number of full res fore beams used
incidence_fore	real	Mean value of full res values
azimuth_fore	real	Mean value of full res values
sigma0_fore	real	Mean value of full res values
sigma0 sq fore	real	Sum of squares
land_frac_fore	real	Mean value of full res values
count_mid	integer	Number of full res mid beams used
incidence_mid	real	Mean value of full res values
azimuth_mid	real	Mean value of full res values
sigma0_mid	real	Mean value of full res values
sigma0 sq mid	real	Sum of squares
land frac mid	real	Mean value of full res values
count aft	integer	Number of full res aft beams used
incidence aft	real	Mean value of full res values
azimuth aft	real	Mean value of full res values
sigma0 aft	real	Mean value of full res values
sigma0 sq aft	real	Sum of squares
land frac aft	real	Mean value of full res values

Table 4.8Full res data structure.

Ice model data: The *icemodel_type* contains information related to the ice screening. The attributes are listed in table 4.9. The routine *init_icemodel()* sets the ice model data to missing values. The routine *print_icemodel()* may be used to print the ice data.

Attribute	Туре	Description
class	integer	Code for WVC being ice or wind
ii	integer	Coordinate on the ice map
jj	integer	Coordinate on the ice map
а	real	Ice coordinate
b	real	Ice coordinate

Attribute	Туре	Description
С	real	Ice coordinate
dIce	real	Distance to the ice line
wind_sol	integer	Wind solution to be used

Table 4.9Ice model data structure.

NWP stress parameter data: The *nwp_stress_param_type* data type contains information relevant for the ice screening and wind stress calculations (stress calculation is not yet implemented in AWDP). The attributes are listed in table 4.10. The routine *init_nwp_stress_param()* sets the NWP stress parameter data to missing values. The routine *print_nwp_stress_param()* may be used to print the stress data.

Attribute	Туре	Description
и	real	Eastward (zonal) wind component
v	real	Northward (meridional) wind component
t	real	Air temperature
q	real	Specific humidity
sst	real	Sea surface temperature
chnk	real	Charnok parameter
sp	real	Surface pressure

Table 4.10 NWP stress parameter data structure.

Row data: The data of a complete row of the swath is stored in the data type *row_type*, see table 4.11. A complete row corresponds to a single BUFR message in the AWDP output. The level 1 BUFR data may contain more than one row per BUFR message..

Attribute	Туре	Description
time_stamp	integer	Time stamp of row data in seconds, used for sorting
num_cells	integer	Actual number of WVC's
<i>Cell(82)</i>	cell_type	Array of Wind Vector Cells

Table 4.11Row data structure.

Time data: The *time_type* data type contains a set of 6 integers representing both the date and the time, see table 4.12. The routine *init_time()* sets the time entries to missing values. The routine *test_time()* tests the validity of the date and time specification (see also the cell process flag). The routine *print_time()* can be used to print the time information.

Attribute	Туре	Description
year	integer	19XX or 20XX
month	integer	1 – 12
day	integer	1 – 31
hour	integer	0-23
minute	integer	0 - 59
second	integer	0 - 59

Table 4.12Time data structure.

Wind Data: The *wind_type* data type contains the wind speed and wind direction, see table 4.13. The routine *init_wind()* sets the wind vector to missing. The routine *print_wind()* may be used to print the wind vector. The routine *test_wind()* tests the validity of the wind specification, see also the cell process flag.

Attribute	Туре	Description
speed	real	Wind speed
dir	real	Wind direction

Table 4.13 Wind data structure.

Some special data types are introduced for the data (quality) flags. These are discussed below.

Beam collocation flag: The *beam_collocation_type* data type is used to indicate whether data of the three beams is originating from a single ground station or from multiple ground stations (collocated data). This is relevant for so-called direct readout data from different ground stations which maybe merged into one single product. In a WVC, e.g. the fore beam information from one ground station may be combined with the mid and aft beam information from another ground station, in order to make a complete WVC. The attributes are listed in table 4.14. The routine *get_beam_collocation()* converts an integer value to the logical beam collocation structure. The routine *set_beam_collocation()* converts a logical beam collocation structure to an integer value.

Attribute	Bit	2^{Bit}	Description
missing			Flag not set (all bits on)
collocation	0	1	Beam information originates from different ground stations

 K_p estimate quality flag: The $kp_estim_qual_type$ data type contains the flag indicating the quality of the K_p estimate. Each one of the three beams in a WVC contain an instance of this flag. The attributes are listed in table 4.15. The function $get_kp_estim_qual()$ interprets an integer flag (BUFR input) to an instance of $kp_estim_qual_type$. The function $set_kp_estim_qual()$ transforms an instance of $kp_estim_qual_type$ to an integer flag.

Attribute	Bit	2 ^{Bit}	Description
missing			Flag not set (all bits on)
estim_qual	0	1	Inferior quality of K_p estimate

Table 4.15	K_p estimate quality flag bits (Fortran).
------------	---

Wind Vector Cell quality flag: Every WVC contains a flag for its quality. Therefore the *cell_type* contains an instance of the *wvc_quality_type*. Table 4.16 gives an overview of its attributes. The function *get_wvc_quality()* interprets an integer flag (BUFR input) to an instance of *wvc_quality_type*. The function *get_wvc_quality()* transforms an instance of *wvc_quality_type* to an integer flag. The routine *print_wvc_quality()* may be used to print the bit values of the flag.

Attribute	Bit	2^{Bit}	Description
missing			Flag not set (all bits on)
qual_sigma0	22	4194304	Not enough good σ^0 available for wind retrieval
azimuth	21	2097152	Poor azimuth diversity among σ^0
kp	20	1048576	Any beam noise content above threshold
monflag	19	524288	Product monitoring not used
monvalue	18	262144	Product monitoring flag
knmi_qc	17	131072	KNMI quality control fails
var_qc	16	65536	Variational quality control fails
land	15	32768	Some portion of wind vector cell is over land
ice	14	16384	Some portion of wind vector cell is over ice
inversion	13	8192	Wind inversion not successful
large	12	4096	Reported wind speed is greater than 30 m/s
small	11	2048	Reported wind speed is less than or equal to 3 m/s
rain fail	10	1024	Rain flag not calculated
rain detect	9	512	Rain detected
no_background	8	256	No meteorological background used
redundant	7	128	Data are redundant
gmf distance	6	64	Distance to GMF too large

Table 4.16 Wind Vector Cell quality flag bits (Fortran).

Cell process flag: Besides a cell quality flag, every WVC contains a process flag. The process flag checks on aspects that are important for a proper processing, but are not available as a check in the cell quality flag. The cell process flag is set by the routine *test_cell*, which calls routines *test_time*, *test_beam* and *test_wind*.

Table 4.17 lists the attributes of the *process_flag_type*. The process flag is only available internally in AWDP. The routine *print_process_flag()* may be used to print the bit values of the flag.

Attribute	Description	
satellite_id	Invalid satellite id	
sat_instruments	Invalid satellite instrument id	
sat motion	Invalid satellite direction of motion	
time	Invalid date or time specification	
latlon	Invalid latitude or longitude	
pixel size hor	Invalid cell spacing	
node nr	Invalid across track cell number	
beam (3)	Invalid data in one of the beams	
model_wind	Invalid background wind	
ambiguity	Invalid ambiguities	
selection	Invalid wind selection	

Table 4.17Cell process flag bits (Fortran).

Table 4.18 provides an overview of all routines and their calls in module *awdp_data*.

Routine	Call	Description
copy_cell		Copy all information from one cell into another
get_beam_collocation	init_cell	Convert integer beam collocation to logical structure

Routine	Call	Description
get_kp_estim_qual	init_beam	Convert integer K_p estimate quality to logical structure
get_wvc_quality	init_cell	Convert integer WVC quality to logical structure
init_ambiguity		Initialise ambiguity structure
init_beam	init_cell	Initialise beam structure
init_cell		Initialise cell structure
init_full_res	init_cell	Initialise full resolution structure
init_icemodel	init_cell	Initialise ice model structure
init_nwp_stress_param	init_cell	Initialise NWP stress parameters structure
init_process_flag	init_cell	Initialise process flag structure
init_time	init_cell	Initialise time structure
init_wind	init_cell	Initialise wind structure
print_ambiguity		Print ambiguity structure
print_beam		Print beam structure
print_cell		Print cell structure
print_full_res		Print full resolution structure
print_icemodel		Print ice model structure

print_wind		Print wind structure
print_wvc_quality		Print quality flag structure
set_beam_collocation		Convert logical beam collocation to integer
set_knmi_flag		Sets/unsets KNMI QC flag depending on other flag settings
set_kp_estim_qual		Convert logical K_p estimate quality to integer
set_wvc_quality		Convert logical WVC quality to integer
test_beam	test_cell	Test validity of beam data
test_cell		Test validity of cell data
test_time	test_cell	Test validity of time data
test_wind	test_cell	Test validity of wind data

Table 4.18Routines in module *awdp_data*

4.3.2 Module *awdp_bufr*

The module *awdp_bufr* maps the AWDP data structure on BUFR messages and vice versa. A list of the BUFR data descriptors can be found in appendix C. Satellite and instrument identifiers are listed in tables 4.19 and 4.20. Note that the first Metop mission is Metop 2, which is also known as Metop A. The *awdp_bufr* module uses the genscat module *BufrMod*, see subsection 4.2.3 for the interface with the BUFR routine library.

Satellite	Value
ERS-1	1
ERS-2	2
Metop 1 = Metop B	3
Metop $2 = Metop A$	4
Metop $3 = Metop C$	5

 Table 4.19
 BUFR satellite identifiers.

Instrument	Parameter	Value
AMI/scatt	sat_instr_ers	142

Instrument	Parameter	Value
ASCAT	sat_instr_ascat	190

Table 4.20 BUFR instrument identifiers.

Table 4.21 provides an overview of the different routines and their calls in this module. The genscat support routines *ymd2julian()* and *julian2ymd()* are used to provide each row in AWDP with a date/time stamp that can be used for sorting easily.

Routine	Call	Description
ascat_bufr_to_row_data	read_bufr_file	ASCAT BUFR message into one or more row_types
ers_bufr_to_row_data	read_bufr_file	ERS BUFR message into 19 row_types
init_bufr_processing	read_bufr_file,	Initialise module
	write_bufr_file	
read_bufr_file	AWDP	Read a complete BUFR file into row_types
row_to_bufr_data	write_bufr_file	AWDP row_type into ASCAT BUFR message
write_bufr_file	AWDP	Write all row_types into a complete BUFR file

 Table 4.21
 Routines in module awdp_bufr

Note that the acquisition date and time of ERS data are modified when they are read in routine *ers_bufr_to_row_data*. An ERS BUFR message contains 19 rows of data which all have the same date and time of acquisition. This would cause problems in AWDP when the rows are sorted with respect to the acquisition date and time. Therefore, the date and time of each ERS row are recalculated assuming that the 10th (middle) row of the ERS BUFR message contains the 'true' acquisition time and that subsequent rows are 3.766 seconds apart. The time corrections are rounded to an integer number of seconds. Hence, in the first row, 34 seconds are subtracted from the acquisition time, in the second row 30 seconds, et cetera, until in the last (19th) row, 34 seconds are added to the acquisition time.

4.3.3 Module *awdp_pfs*

The module *awdp_pfs* maps the records in a PFS file on the AWDP data structure. It also contains a routine to read in a full resolution PFS file and use the data to calculate averaged beam data which are used to replace 25/12.5-km row data.

Table 4.22 provides an overview of the different routines and their calls in this module. Several routines from the *pfs_ascat* module in genscat are called from this module to handle the PFS data. Appendix B5 shows the calling trees of the routines in module *pfs_ascat* that are used in AWDP.

Routine	Call	Description
ascat_pfs_to_row_data	read_pfs_file	ASCAT PFS record into one row_type
read full res data	AWDP	Read full resolution PFS data and replace beam data
read_pfs_file	AWDP	Read a complete PFS level 1b file into row_types

Table 4.22 Routines in module *awdp_pfs*

4.3.4 Module *awdp_prepost*

Module *awdp_prepost* contains the routines to do all the pre and post processing. Pre processing consists of the procedures between the reading of the BUFR input and the wind retrieval for the output product. This includes sorting and merging, and assessments of the quality of the input data. Post processing consists of the procedure between the ambiguity removal step and the BUFR encoding of the output. The post processing includes the monitoring of the wind data and the setting of some of the flags in the output product.

Routine	Call	Description
calibrate_s0	AWDP	Apply σ^0 calibration
merge_rows	preprocess	Merge the data of two input rows
monitoring	postprocess	Monitoring
postprocess	AWDP	Main routine of the post processing
pre_inversion_qc	preprocess	Perform quality checks on input data
preprocess	AWDP	Main routine of the pre processing
process_cleanup	AWDP	Memory management
write_binary_output	postprocess	Write WVC data to a binary output file
write_properties	postprocess	Write some properties of the data into a text file

Table 4.23 Routines of module *awdp_prepost*.

Table 4.23 lists the tasks of the individual routines. AWDP calls *preprocess()* to sort the rows with respect to the acquisition data and time. It also checks on the appearance of double rows, that is, rows which are less than half the nominal cell distance (pixel size on horizontal in the input data) apart. If *preprocess()* finds a double row it merges the two rows into one row. In that case the number of input rows will be reduced. Once the input rows are sorted and merged, an output row structure is allocated ant the input data are copied into the output rows.

The routine *pre_inversion_qc()* which is called by *preprocess()* performs land flagging and checks the setting of flags in the level 1b beam information. If the input data is of inferior quality, the *qual_sigma0* flag in the *wvc_quality* is set, which prevents further processing of this WVC. Also the land fractions present in the beam information in the level 1b product are considered: if any land fraction in the fore, mid or aft beam exceeds 0.02, the *qual_sigma0* flag in *wvc_quality* is set, as well. The *land* flag in *wvc_quality* is set whenever any level 1b land fraction is above zero.

The next step is the calibration of the σ^{0} 's in *calibrate_s0*. Calibration coefficients for each level 1 processing version and instrument (ASCAT on Metop A or Metop B) have been obtained using the so-called NWP Ocean Calibration (NOC). Note that the calibration is done again in the reverse order after the post processing in order to write the σ^{0} 's to output as plain copies of the input σ^{0} 's. More information about the calibration can be found in [*Verspeek et al.*, 2012].

The monitoring, which is performed as part of the post processing, calculates some statistics from the wind product and writes them to an ASCII file called *monitoring_report.txt*. The monitoring parameters are listed in table 4.24. They are calculated separately for three different regions of each swath (left and right). Note that the monitoring is invoked only if the -mon command line option is set.

AWDP User Manual and Reference Guide

Parameter	Description
observation	Number of Wind Vector Cells in output = NI
land	Fraction of WVCs with land flag set
ice	Fraction of WVCs with ice flag set
background	Fraction of WVCs containing model winds
backscatter_info	Fraction of WVCs containing sufficient valid σ^{0} 's for inversion =N2
knmi_flag	Ratio number of WVCs with KNMI QC flag set / N2
wind_retrieval	Fraction of $N2$ that actually contains wind solutions = $N3$
wind_selection	Fraction of N3 that actually contains a wind selection = $N4$
big_mle	Number of WVCs containing a wind solution but no MLE value
avg_mle	Averaged (over N4) MLE value of 1 st wind selection
var_qc	Fraction of N4 that has the Variational QC flag set
rank_1_skill	Fraction of N4 where the first wind solution is the chosen one
avg_wspd_diff	Averaged (over N4) difference between observed and model wind speeds
rms_diff_wspd	RMS (over N4) difference between observed and model wind speeds
wspd_ge_4	Fraction of N4 where the selected wind speed is $\ge 4 \text{ m/s} = N5$
rms_diff_dir	RMS (over N5) difference between observed and model wind directions
rms_diff_u	RMS (over N5) difference between observed and model wind u components
rms_diff_v	RMS (over N5) difference between observed and model wind v components
rms_diff_vec_len	RMS (over N5) vector length between observed and model winds
ambiguity	Fraction of N5 where the chosen solution is not the one closest to the model wind

 Table 4.24
 Parameters in monitoring output.

4.3.5 Module *awdp_grib*

The module *awdp_grib* reads in ECMWF GRIB files and collocates the model data with the scatterometer measurements. The *awdp_grib* module uses the genscat module *gribio_module*, see subsection 4.2.5 for the interface with the GRIB routine library.

Table 4.25 provides an overview of the routines and their calls in this module. The genscat support routines *uv_to_speed()* and *uv_to_dir()* are used to convert NWP wind components into wind speed and direction.

Routine	Call	Description
get_grib_data	AWDP	Get land mask, ice mask and background winds using GRIB data
init_grib_processing	get_grib_data	Initialise module

Table 4.25Routines in module *awdp grib*

NWP model sea surface temperature and land-sea mask data are used to provide information about possible ice or land presence in the WVCs. WVCs with a sea surface temperature below 272.16 K (-1.0 °C) are assumed to be covered with ice and the *ice* and *qual_sigma0* flags in *wvc_quality* are set. Note that this step is omitted if the Bayesian ice screening is used; see section 4.3.7.

Land presence within each WVC is determined using the land-sea mask available from the model data. The weighted mean value of the land fractions of all model grid points within 80 km of the WVC centre is calculated and if this mean value exceeds a threshold of 0.02, the *qual_sigma0* flag in *wvc_quality* is set. The *land* flag in *wvc_quality* is set if the calculated land fraction is above zero.

NWP forecast wind data are necessary in the ambiguity removal step of the processing. Wind

forecasts with forecast time steps of +3h, +6h, ..., +36h can be read in. The model wind data are linearly interpolated with respect to time and location and put into the *model_wind* part of each WVC.

4.3.6 Module *awdp_inversion*

Module *awdp_inversion* serves the inversion step in the wind retrieval. The inversion step is done cell by cell. The actual inversion algorithm is implemented in the genscat modules *inversion* and *post_inversion*, see subsection 4.2.1. Table 4.26 provides an overview of the routines and their calls in this module.

Routine	Call	Description
init_inversion	invert_wvcs	Initialisation
invert node	invert wvcs	Call to the genscat inversion routines
invert_wvcs	AWDP	Loop over all WVCs and perform inversion

Table 4.26Routines of module *awpd inversion*.

4.3.7 Module *awdp_ambrem*

Module *awdp_ambrem* controls the ambiguity removal step of the AWDP program. The actual ambiguity removal schemes are implemented in the genscat module *ambrem*, see section 4.2.2. The default method is the KNMI 2DVAR scheme. Table 4.27 lists the tasks of the individual routines.

Routine	Call	Description
fill_batch	remove_ambiguities	Fill a batch with observations
remove ambiguities	AWDP	Main routine of ambiguity removal
select_wind	remove_ambiguities	Final wind selection

Table 4.27 Routines of module *awpd_ambrem*.

The ambiguity removal scheme works on a so-called batch. The batch is defined in the *fill_batch()* routine. For the AWDP program a batch is just a set of rows. The size of the batch is determined by the resolution of the structure functions and the number of FFT. The genscat routine *remove_ambiguities()* performs the actual ambiguity removal. Finally *select_wind()* passes the selection to the output WVCs.

4.3.8 Module *awdp_icemodel*

Module *awdp_icemodel* performs the ice screening of the wind product. The ice screening works on the principle that WVCs over water yield wind solutions which are close to the GMF ('cone'). If a WVC is over ice, the σ^0 triplets from fore, mid and aft beam will be close to the so-called ice line. Hence, there is a possibility to discriminate between water (wind) and ice WVCs. The implementation of this principle is described in more detail in [*Belmonte et al.*, 2012]. The ice screening is done directly after the ambiguity removal step. Table 4.28 provides an overview of the routines and their calls in this module.

Routine	Call	Description
bayesianIcemodel	ice_mode	Implementation of the Bayesian ice model
calc_aAve	bayesianIcemodel	Calculate space-time averaged A-parameter
calc_aSd	bayesianIcemodel	Calculate standard deviation of A-parameter
calcIceCoord	bayesianIcemodel	Calculate ice coordinates and distance to ice line
calcIcelineParms	nonbayesianIceModel calcIceCoord	Calculate distance to ice line from given σ^{0} 's
calc pIceGivenX	bayesianIcemodel	Calculate a posteriori ice probability
calcSubClass	bayesianIcemodel	Determine the sub class of the ice pixel
getPx	updateIcePixel	Calculate a priori ice probability
iceGMF	not used	Calculate the σ^0 values from the ice coordinates
iceLine	<i>iceGMF</i> (not used)	Calculate the ice line origin and slope
iceMap2scat	bayesianIcemodel	Update cell data structure with information in ice map
ice_model	AWDP	Main routine of ice screening
nonbayesianIceModel	ice mode	Implementation of the basic ice model without history
scat2iceMap	bayesianIcemodel	Update the ice map with the information in cell data
setCmix	bayesianIcemodel	Compute geophysical ice model tolerance parameter
smooth	bayesianIcemodel	Spatial smoothing of the a posteriori probability
updateIcePixel	scat2iceMap	Update one ice pixel

Table 4.28 Routines of module awdp_icemodel.

4.3.9 Module *awdp*

Module *awdp* is the main program of AWDP. It processes the command line options and controls the flow of the wind processing by calling the subroutines performing the subsequent processing steps. If any process step returns with an error code, the processing will be terminated.

Chapter 5

Inversion module

5.1 Background

In the inversion step of the wind retrieval, the radar backscatter observations in terms of the normalized radar cross-sections (σ^{0} 's) are converted into a set of ambiguous wind vector solutions. In fact, a Geophysical Model Function (GMF) is used to map a wind vector (specified in term of wind speed and wind direction) to the σ^{0} values. The GMF further depends not only on wind speed and wind direction, but also on the measurement geometry (relative azimuth and incidence angle), and beam parameters (frequency, polarisation). A maximum likelihood estimator (MLE) is used to select a set of wind vector solutions that optimally match the observed σ^{0} 's. The wind vector solutions correspond to local minima of the MLE function

$$MLE = \frac{1}{N} \sum_{i=1}^{N} \frac{\left(\sigma_{0}^{obs}(i) - \sigma_{0}^{GMF}(i)\right)^{2}}{K_{p}} \quad ,$$
(5.1)

With *N* the number of independent σ^0 measurements available within the wind vector cell, and K_p the covariance of the measurement error. Following a Bayesian approach, K_p is a constant representing the noise in all three ERS or ASCAT beams together [*Stoffelen and Portabella*, 2006]. This selection depends on the number of independent σ^0 values available within the wind vector cell. The MLE can be regarded upon as the distance between an actual scatterometer measurement and the GMF in N-dimensional measurement space. The MLE is related to the probability *P* that the GMF at a certain wind speed and direction represents the measurement by

$$P \propto e^{-MLE}$$
 (5.2)

Therefore, wind vectors with low MLE have a high probability of being the correct solution. On the other hand, wind vectors with high MLE are not likely represented by any point on the GMF.

Details on the inversion problem can be found in [*Stoffelen and Portabella*, 2006; *Portabella*, 2002]. The AWDP program includes the Multiple Solution Scheme (MSS), see [*Portabella and Stoffelen*, 2001].

5.2 Routines

The inversion module class contains two modules named *inversion* and *post_inversion*. They are located in subdirectory genscat/inversion. Tables 5.1 and 5.2 list all routines in the modules. Appendix B.1 shows the calling tree for the inversion routines.

Routine	Call	Routine	Call
invert_one_wvc	AWDP	INTERPOLATE	generic
fill wind quality code	invert one wvc	interpolate1d	calc sigma0
save inv input	not used	interpolated2d	calc sigma0
read inv input	not used	interpolate2dv	calc_sigma0

check_ers_ascat_inversion_data	see B.1
check_wind_solutions_ers_ascat	AWDP
remove_one_solution	check_wind_solutions_ers_ascat
calc_probabilities	AWDP

To establish the MLE function (1), the radar cross section according to the GMF, σ^0_{GMF} , must be calculated. This is done in routine *calc_sigma0*. The GMF used is read as a Look Up Table (LUT) from a binary file. The value for σ^0_{GMF} is obtained from interpolation of this table. The

interpolation is done via symbolic routine *INTERPOLATE* which is set to *interpolate1d*, *interpolate2d*, *interpolate2dv*, or *interpolate3d*, depending on the type of interpolation needed.

For C-band at VV polarization the GMF (CMODx, see [*Hersbach, Stoffen and de Haan, 2007*]) is given in analytical form (routines *calc_sigma0_cmodxxx*). If a C-band LUT is not present it will be created by routine *create_LUT_C_VV*. This routine calls one of the routines *calc_sigma0_cmodxxx* that contain the analytical expressions of the CMOD4 or CMOD5 algorithm. There is a parameter in the inversion settings type that is used to determine which CMOD function is to be used. Routines *get_lun* and *free_lun* from module *LunManager* in subdirectory genscat/support/file are needed when reading and creating the LUTs.

Note that module *post_inversion* uses some tables for the normalisation of MLEs and noise values. These tables are read from ASCII files which are present in direction genscat/inversion. The environment variable \$INVERSION_LUTSDIR should contain the proper directory name.

5.3 Antenna direction

The output wind direction of inversion routines are generally given in the meteorological convention, see table 5.3. The inversion routine uses a wind direction that is relative to the antenna direction. The convention is that if the wind blows towards the antenna then this relative wind direction equals to 0. Therefore, it is important to be certain about the convention of your antenna (azimuth) angle.

For ERS and ASCAT, the radar look angle (antenna angle or simply azimuth) equals 0 if the antenna is orientated towards the south. The radar look angle increases clockwise. Therefore, the antenna angle needs a correction of 180 degrees.

Meteorological	Oceanographic	Mathematical	и	v	Description
0	180	270	0	-1	Wind blowing from the north
90	270	180	-1	0	Wind blowing from the east
180	0	90	0	1	Wind blowing from the south
270	90	0	1	0	Wind blowing from the west

Table 5.3 Conventions for the wind direction.

Chapter 6

Ambiguity Removal module

6.1 Ambiguity Removal

Ambiguity Removal (AR) schemes select a surface wind vector among the different surface wind vector solutions per cell for the set of wind vector cells in consideration. The goal is to set a unique, meteorological consistent surface wind field. The surface wind vector solutions per cell, simply called ambiguities, result from the wind retrieval process step.

Whenever the ambiguities are ranked, a naive scheme would be to select the ambiguity with the first rank (e.g., the highest probability, the lowest distance to the wind cone). In general, such a persistent first rank selection will not suffice to create a realistic surface wind vector field: scatterometer measurements tend to generate ambiguous wind solutions with approximately equal likelihood (mainly due to the $\sim 180^{\circ}$ invariance of stand alone scatterometer measurements). Therefore additional spatial constraints and/or additional (external) information are needed to make sensible selections.

A common way to add external information to a WVC is to provide a background surface wind vector. The background wind acts as a first approximation for the expected mean wind over the cell. In general, a NWP model wind is interpolated for this purpose. Whenever a background wind is set for the WVC, a second naive Ambiguity Removal scheme is at hand: the Background Closest (BC) scheme. The selected wind vector is just the minimizer of the distance (e.g., in the least squares sense) to the background wind vector. This scheme may produce far more realistic wind vector fields than the first rank selection, since the background surface wind field is meteorologically consistent.

However, background surface winds have their own uncertainty. Therefore, sophisticated schemes for Ambiguity Removal take both the likelihood of the ambiguities and the uncertainty of the background surface wind into account. Examples are the KNMI Two-Dimensional Variational (2DVAR) scheme and the PreScat scheme.

The implementation of these schemes is described in sections 6.4 and 6.5.

6.2 Module *ambrem*

Module *Ambrem* is the interface module between the various ambiguity removal methods and the different scatterometer data processors. Table 6.1 provides an overview of the different routines

and their calls. A dummy method and the first rank selection method are implemented as part of *ambrem*. More elaborate Ambiguity Removal methods have an interface module, see table 6.2. Figure 6.1 shows schematically the interdependence of the various modules for Ambiguity Removal.

Routine	Call	Description
InitAmbremModule	AWDP	Initialization of module Ambrem
<i>InitAmbremMethod</i>	AWDP	Initialization of specified AR scheme
DoAmbrem	AWDP	Execution of specified AR scheme
Ambrem1stRank	DoAmbrem	First rank selection method
DoDummyMeth	DoAmbrem	Dummy AR scheme for testing
SetDummyMeth	DoAmbrem	Batch definition of dummy method
<i>InitDummyMeth</i>	DoAmbrem	Initialization of dummy method
InitDummyBatch	not used	
<i>ExitAmbremMethod</i>	AWDP	Deallocation of memory

AmbremBGClosest	Interface to Background Closest method	Section 6.1
AmbremPrescat	Interface to Prescat method	Section 6.5

 Table 6.2
 Interface modules for different Ambiguity Removal schemes.

6.3 Module *BatchMod*

After the wind retrieval step, the Ambiguity Removal step is performed on selections of the available data. In general, these selections are just a compact part of the swath or a compact part of the world ocean. The batch module *BatchMod* facilitates these selections of data. In fact, a batch data structure is introduced to create an interface between the swath related data and the data structures of the different AR methods. Consequently, the attributes of the batch data structures are a mixture of swath items and AR scheme items. Figure 6.2 gives a schematic overview of the batch data structure. Descriptions of the attributes of the individual batch data components are given in table 6.3.

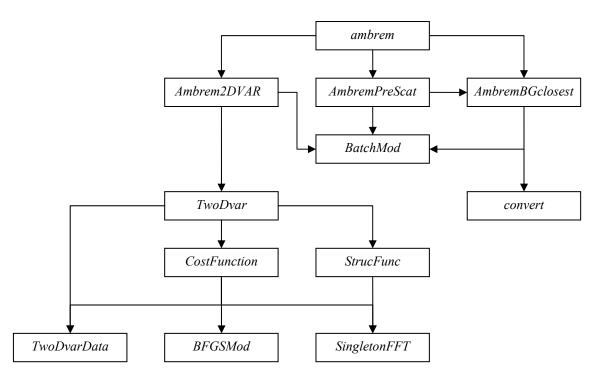

Figure 6.1 Interdependence of the modules for Ambiguity Removal. The connections from module *ambrem* to module *BatchMod* and from module *Ambrem2DVAR* to *convert* are not drawn.

6.4 The KNMI 2DVAR scheme

6.4.1 Introduction

The purpose of the KNMI 2DVAR scheme is to make an optimal selection provided the (modelled) likelihood of the ambiguities and the (modelled) uncertainty of the background surface wind field. First, an optimal estimated surface wind vector field (analysis) is determined based on variational principles. This is a very common method originating from the broad discipline of Data Assimilation. The optimal surface wind vector field is called the analysis. Second, the selected wind vector field (the result of the 2DVAR scheme) consists of the wind vector solutions that are closest to the analysis wind vector. For details on the KNMI 2DVAR scheme formulation the reader is referred to [*Vogelzang*, 2007]. Information on 2DVAR can also be found in [*Stoffelen, de Haan, Quilfen and Schyberg*, 2000; *de Vries, Stoffelen and Beysens*, 2005; *de Vries and Stoffelen*, 2000].

The calculation of the cost function and its gradient is rather complex matter. The reader who is only interested in how the 2DVAR scheme is assembled into the genscat module class *ambrem* is referred to subsection 6.4.2. Readers interested in the details of the cost function calculations and the minimization should also read the subsequent subsections. Subsection 6.4.3 forms an introduction to the cost function. It is recommended to first read this section, because it provides necessary background information to understand the code. Subsection 6.4.7 on the actual minimization and subsection 6.4.8 on Fast Fourier Transforms are in fact independent of the cost function itself. The reader might skip these subsections.

6.4.2 Data structure, interface and initialisation

The main module of the 2DVAR scheme is *TwoDvar*. Within the genscat ambiguity removal module class, the interface with the 2DVAR scheme is set by module *Ambrem2DVAR*. Table 6.6 lists its routines that serve the interface with *TwoDvar*.

Routine	Call	Description
Do2DVARonBatch	DoAmbrem	Apply 2DVAR scheme on batch
BatchInput2DVAR	Do2DVARonBatch	Fills the 2DVAR data structure with input
BatchOutput2DVAR	Do2DVARonBatch	Fills the batch data structure with output
Set WVC Orientations	BatchInput2DVAR	Sets the observation orientation
GetBatchSize2DVAR		Determine maximum size of batch

Table 6.6 Routines of module Ambrem2DVAR.

These routines are sufficient to couple the 2DVAR scheme to the processor. The actual 2DVAR processing is done by the routines of module *TwoDvar* itself. These routines are listed in table 6.7. Figures B2.1-B2.6 show the complete calling tree of the AR routines.

Routine	Call	Description
InitTwodvarModule		Initialization of module TwoDvar
Do2DVAR	Do2DVARonBatch	Cost function minimization
PrintObs2DVAR	BatchInput2DVAR	Print a single 2DVAR observation
ExitTwodvarModule	ExitAmbremMethod	Deallocation of module TwoDvar

Table 6.7 Routines of module *TwoDvar*.

The *Obs2dvarType* data type is the main data structure for the observed winds. Its attributes are listed in table 6.8. The *TDV_Type* data type contains all parameters that have to do with the 2DVAR batch grid: dimensions, sizes, and derived parameters. These data structures are defined in module *TwoDvarData* and the routines in this module are listed in table 6.10.

Attribute	Туре	Description
alpha	Real	Rotation angle
cell	Integer	Store batch cell number
row	Integer	Store batch row number
igrid	Integer	Row index
jgrid	Integer	Node index
lat	Real	Latitude to determine structure function
Wll	Real	Weight lower left
Wlr	Real	Weight lower right
Wul	Real	Weight upper left
Wur	Real	Weight upper right
ubg	Real	Background EW wind component
vbg	Real	Background NS wind component
NrAmbiguities	Integer	Number of ambiguities
incr()	AmbiIncrType	Ambiguity increments
uAnaIncr	Real	Analysis increment
vAnaIncr	Real	Analysis increment
selection	Integer	Selection flag
QualFlag	TwoDvarQualFlagType	Quality control flag
f	Real	Cost function at observation
gu	Real	df/du
gv	Real	df/dv

Table 6.8 The Obs2dvarType data structure.

Attribute	Туре	Description
delta	Real	2DVAR grid size in position domain
delta_p	Real	2DVAR grid size in frequency domain
delta_q	Real	2DVAR grid size in frequency domain
NI	Integer	Dimension 1 of 2DVAR grid
Hl	Integer	N1/2
K1	Integer	<i>H1</i> +1;number of nonnegative frequencies
N2	Integer	Dimension 2 of 2DVAR grid
H2	Integer	N2/2
K2	Integer	H2+1;number of nonnegative frequencies
Ncontrol	Integer	Size of control vector

Table 6.9 The *TDV_Type* data structure.

Routine	Call	Description
TDV_Init	InitTwodvarModule	Initialization of 2DVAR grid and preparations
Set_HelmholzCoefficients	TDV_Init	Set Helmholz transformation coefficients
Set_CFW	TDV_Init	Set cost function weights
TDV_Exit	ExitTwodvarmodule	Deallocate memory
InitObs2dvar	BatchInput2DVAR,	Allocation of observations array
	BatchOutput2DVAR	
DeallocObs2dvar	BatchOutput2DVAR	Deallocation of observations array
InitOneObs2dvar	InitObs2dvar	Initialization of single observation
TestObs2dvar	Do2DVAR	Test single observation
Prn2DVARQualFlag	Do2DVAR	Print observation quality flag
set2DVARQualFlag	TestObs2DVAR	Convert observation quality flag to integer
get2DVARQualFlag	not used	Convert integer to observation quality flag

Table 6.10Routines in module *TwoDvarData*.

The quality status of an instance of *Obs2dvarType* is indicated by the attribute *QualFlag* which is an instance of *TwoDvarQualFlagType*. The attributes of this flag are listed in table 6.11.

Attribute	Description	
missing	Flag values not set	
wrong	Invalid 2DVAR process	
Lat	Invalid latitude	
Background	Invalid background wind increment	
Ambiguities	Invalid ambiguity increments	
Selection	Invalid selection	
Analyse	Invalid analysis wind increment	
Cost	Invalid cost function specification	
gradient	Invalid gradient specification	
weights	Invalid interpolation weights	
grid	Invalid grid indices	

Table 6.11Attributes of 2DVAR observation quality flag.

6.4.3 Reformulation and transformation

The minimization problem to find the analysis surface wind field (the 2D Variational Data Assimilation problem) may be formulated as

$$\min_{v} J(v) \quad , \quad J(v) = J_{obs}(v) + J_{bg}(v), \tag{6.1}$$

where v is the surface wind field in consideration and J the total cost function consisting of the observational term J_{obs} and the background term J_{bg} . The solution, the analysis surface wind field, may be denoted as v_a . Being just a weighted least squares term, the background term may be further specified as

$$J_{bg}(v) = [v - v_{bg}]^T B^{-1} [v - v_{bg}], \qquad (6.2)$$

where *B* is the background error covariance matrix. The J_{obs} term of the 2DVAR scheme is not simply a weighted least squares term.

Such a formulation does not closely match the code of the 2DVAR scheme. In fact, for scientific and technical reasons several transformations are applied to reformulate the minimization problem. Description of these transformations is essential to understand the different procedures within the code. The interested reader is referred to [*Vogelzang* 2007].

6.4.4 Module CostFunction

Module *CostFunction* contains the main procedure for the calculation of the cost function and its gradient. It also contains the minimization procedure. Table 6.12 provides an overview of the routines.

Routine	Call	Description
Jt	Minimise	Total cost function and gradient
Jb	Jt	Background term of cost function
Jo	Jt	Observational term of cost function
JoScat	Jo	Single observation contribution to the cost function
Unpack_ControlVector	Jo	Unpack of control vector
Pack_ControlVector	Jo	Pack of control vector (or its gradient)
Uncondition	Jo	Several transformations of control vector
Uncondition_adj	Jo	Adjoint of Uncondition.
Minimise	Do2DVAR (TwoDvar)	Minimization
DumpAnalysisField	Do2DVAR	Write analysis field to file

Table 6.12 Routines of module CostFunction.

6.4.5 Adjoint method

The minimization of cost function is done with a quasi-Newton method. Such a method requires an accurate approximation of the gradient of the cost function. The adjoint method is just a very economical manner to calculate this gradient. For introductory texts on the adjoint method and adjoint coding, see, e.g., [*Talagrand*, 1991; *Giering*, 1997]. For detailed information on the adjoint

model in 2DVAR see [Vogelzang 2007].

6.4.6 Structure Functions

Module *StrucFunc* contains the routines to calculate the covariance matrices for the stream function, ψ , and the velocity potential, χ . Its routines are listed in table 6.13.

Routine	Call	Description
<i>SetCovMat</i>	Do2DVAR	Calculate the covariance matrices
InitStrucFunc	<i>SetCovMat</i>	Initialize the structure functions
StrucFuncPsi	<i>SetCovMat</i>	Calculate ψ
StrucFuncChi	<i>SetCovMat</i>	Calculate χ

Table 6.13 Routines of module StrucFunc.

Routine InitStrucFunc sets the structure function parameters to a default value.

6.4.7 Minimization

The minimization routine used is *LBFGS*. This is a quasi Newton method with a variable rank for the approximation of the Hessian written by J. Nocedal. A detailed description of this method is given by [*Liu and Nocedal* 1989]. Routine LBFGS is freeware and can be obtained from web page http://www.netlib.org/opt/index.html, file lbfgs_um.shar. The original Fortran 77 code has been adjusted to compile under Fortran 90 compilers. Routine LBFGS and its dependencies are located in module BFGSMod.F90 in directory genscat/support/BFGS. Table 6.14 provides an overview of the routines in this module.

Routine LBFGS uses reverse communication. This means that the routine returns to the calling routine not only if the minimization process has converged or when an error has occurred, but also when a new evaluation of the function and the gradient is needed. This has the advantage that no restrictions are imposed on the form of routine Jt calculating the cost function and its gradient.

The formal parameters of *LBFGS* have been extended to include all work space arrays needed by the routine. The work space is allocated in the calling routine *minimise*. The rank of *LBFGS* affects the size of the work space. It has been fixed to 3 in routine *minimise*, because this value gave the best results (lowest values for the cost function at the final solution).

Routine	Call	Description
LBFGS	minimise	Main routine
LB1	LBFGS	Printing of output (switched off)
daxpy	LBFGS	Sum of a vector times a constant plus another vector with loop unrolling.
ddot	LBFGS	Dot product of two vectors using loop unrolling.
MCSRCH	LBFGS	Line search routine.
MCSTEP	MCSRCH	Calculation of step size in line search.

Table 6.14Routines in module *BFGSMod*.

Some of the error returns of the line search routine *MCSRCH* have been relaxed and are treated as a normal return. Further details can be found in the comment in the code itself.

Routines *daxpy* and *ddot* were rewritten in Fortran 90. These routines, originally written by J. Dongarra for the Linpack library, perform simple operations but are highly optimized using loop unrolling. Routine *ddot*, for instance, is faster than the equivalent Fortran 90 intrinsic function *dot_product*.

6.4.8 SingletonFFT_Module

Module *SingletonFFT_Module* in directory genscat/support/singletonfft contains the multi-variate complex Fourier routines needed in the 2DVAR scheme. A mixed-radix Fast Fourier Transform algorithm based on the work of R.C. Singleton is implemented.

Routine	Call	Description
SingletonFFT2d	SetCovMat, Uncondition,	2D Fourier transform
	Uncondition_adj	
fft	SingletonFFT2d	Main FFT routine
SFT_Permute	fft	Permute the results
SFT_PermuteSinglevariate	SFT_Permute	Support routine
SFT_PermuteMultivariate	SFT_Permute	Support routine
SFT_PrimeFactors	fft	Get the factors making up N
SFT_Base2	fft	Base 2 FFT
SFT_Base3	fft	Base 3 FFT
SFT_Base4	fft	Base 4 FFT
SFT_Base5	fft	Base 5 FFT
SFT_BaseOdd	fft	General odd-base FFT
SFT_Rotate	fft	Apply rotation factor

Table 6.15Fourier transform routines.

Table 6.15 gives an overview of the available routines. The figures in Appendix B2 shows the calling tree of the FT routines relevant for 2DVAR.

Remark: the 2DVAR implementation can be made more efficient by using a real-to-real FFT routine rather than a complex-to-complex one as implemented now. Since AWDP satisfies the requirements in terms of computational speed, this has low priority.

6.5 The PreScat scheme

The PreScat ambiguity removal scheme can be invoked within AWDP by the use of command line option -armeth prescat. More information on this scheme can be found in [*Stoffelen, de Haan, Quilfen and Schyberg,* 2000]. Currently, the PreScat scheme can be used only in combination with ERS data.

Chapter 7

Module *iceModelMod*

Module *iceModelMod* is part of the genscat support modules. It contains all the routines for initialising, reading, writing and printing of the SSM/I grids for the North Pole and South Pole region.

7.1 Background

The -icemodel option in AWDP basically fills the fields Ice Probability (BUFR item 87) and Ice Age (BUFR item 88). Also it can output graphical maps of ice model related parameters on an SSM/I grid for the North Pole and for the South Pole region.

Each time the Metop satellite passes over the pole region the corresponding ice map is updated with the new ASCAT data. A spatial and temporal averaging is performed in order to digest the new information. After the overpass, at the end of processing an entire BUFR file, the updated information on the ice map is put back into the BUFR structure. Optionally graphical maps are plotted, which can be controlled by optional input parameters for routine printIceMap. The graphical filenames have encoded the North Pole/South Pole, the date/time as well as the parameter name. The most important ones are:

print_a: file [N|S][yyyymmddhhmmss].ppm contains the ice subclass and the a-ice parameter on a grey-scale for points classified as ice.

print_t: file [N|S][yyyymmddhhmmss]t.ppm contains the ice class.

print sst: file [N|S][yyyymmddhhmmss]sst.ppm contains the sea surface temparature

print_postprob: file [N|S][yyyymmddhhmmss]postprob.ppm contains the a-posteriori ice probability.

Typically at least two days of ASCAT data are needed to entirely fill the ice map with data and give meaningful ice model output. Because AWDP handles only one BUFR file at a time, a script is needed that calls AWDP several times. After each AWDP-run a binary restart file is written to disk containing the information of an icemap (latestlceMapN.rst for the North Pole and latestlceMapS.rst for the South Pole). With the next call of awdp, these restart files are read in again. Environment variable \$RESTARTDIR contains the directory for the ice model restart files.

Optionally sea surface temperature (SST) data from GRIB files can be used to further improve the

quality of the ice algorithm (the use sst logical must be turned on).

Processing 11b input with the use of NWP data and SST data can be done with the following command line options:

```
awdp -f <bufr file> -nwpfl <gribfilelist> -icemodel 2 -mon -
handleall
```

Reprocessing of level 2 input with only running the ice model on top of it can be done with the following command line options:

awdp -f <bufr file> -icemodel 2 -noinv -noamb -mon -handleall

The SSM/I grids are widely used for representation of ice related parameters. A good description as well as some software routines can be found on the website of the National Snow and Ice Data Centre (NSIDC): <u>http://www.nsidc.org/data/docs/daac/ae_si25_25km_tb_and_sea_ice.gd.html</u>.

A more detailed description of the Bayesian statistics method and ice model is given in [Belmonte et al., 2012].

7.2 Routines

Table 7.1 provides an overview of the routines in module *iceModelMod*.

Routine	Call	Description
calcPoly3	AWDP	Calculate a 3 rd order polynomial
ExpandDateTime	AWDP	Converts a date/time to a real
ij2latlon	not used	Calculate lat lon values from SSM/I grid coordinates
<i>initIceMap</i>	AWDP	Initialise ice map
inv_logit	not used	Calculate the inverse of the logit of p: 1/(1+exp(-p))
latlon2ij	AWDP	Calculate SSM/I grid coordinates from lat lon values
logit	not used	Calculate the logit of p: $ln(p/(1-p))$
MAPLL	latlon2ij	Convert from lat/lon to polar stereographic coordinates
MAPXY	ij2latlon (not used)	Convert from polar stereographic to lat/lon coordinates
printClass	not used	Print the ice class (sea or ice)
print_ice_age_ascat	not used	Print ice age map to graphical .ppm file
printIceAscat	printIceMap	Print ASCAT ice map to graphical .ppm file
printIceMap	bayesianIcemodel	Print one or more ice map variables to graphical .ppm files
printIcePixel	AWDP	Print contents of an ice pixel
printIceQscat	printIceMap	Print QuikSCAT ice map to graphical .ppm file
printppm_qc	not used	Print WVC quality flag contents to graphical .ppm file
printppmvar	printIceMap	Print variable to .ppm file, mapped on gray scale
printppmvars	not used	Print three variables to .ppm file, mapped to an RGB scale
printSubclass	printIceMap	Print the ice subclass to a .ppm file
RW_IceMap	AWDP	Read or write an ice map from/to a binary restart file
wT	AWDP	Calculate the moving time average function

Table 7.1 Routines of module *iceModelMod*.

7.3 Data structures

There are two important data structures defined in this module. The first contains all relevant data of one pixel on the ice map (IcePixel). The second one contains basically a two-dimensional array

of ice pixels and represents an entire ice map (IceMapType). This could be either an ice map of the North Pole region or the South Pole region.

Attribute	Туре	Description
aIce	real	A ice parameter
aIceAves	real	Average of the A ice parameter
aSd	real	A ice parameter standard deviation
class	integer	Ice class
subClass	integer	Ice subclass
sst	real	Sea surface temperature (K)
pXgivenIce	real	
pXgivenOce	real	
pYgivenIce	real	
pYgivenOce	real	
Pice	real	A-priori ice probability
pIceGivenX	real	A-posteriori ice probability
pIceGivenXave	real	Average of a-posteriori ice probability
sumWeightST	real	Sum of weight factors
landmask	logical	land/sea indicator
timePixelNow	DateTime	Date/time of measurement
timePixelPrev	DateTime	Date/time of previous measurement

Table 7.2 Attributes for the *IcePixel* data type.

Attribute	Туре	Description
nPixels	integer	Number of pixels for the ice map
nLines	integer	Number of lines for the ice map
pole	integer	Indicator for Northpole or Southpole
use sst	integer	Use SST value in ice screening
<i>timeMapNow</i>	DateTime	Date/time of latest ice map update
timeMapPrev	DateTime	Date/time of previous ice map update
xy	IcePixel(nPixels, nLines)	Pointer to the ice map contents

Table 7.3 Attributes for the *IceMapType* data type.

Chapter 8

Module BufrMod

Module *BufrMod* is part of the genscat support modules. The current version is a Fortran 90 wrapper around the ECMWF BUFR library (see <u>http://www.ecmwf.int/</u>). The goal of this support module is to provide a comprehensive interface to BUFR data for every Fortran 90 program using it. In particular, *BufrMod* provides all the BUFR functionality required for the scatterometer processor based on genscat. Special attention has been paid to testing and error handling.

8.1 Background

The acronym BUFR stands for Binary Universal Form for the Representation of data. BUFR is maintained by the World Meteorological Organization WMO and other meteorological centres. In brief, the WMO FM-94 BUFR definition is a binary code designed to represent, employing a continuous binary stream, any meteorological data. It is a self defining, table driven and very flexible data representation system. It is beyond the scope of this document to describe BUFR in detail. Complete descriptions are distributed via the websites of WMO (http://www.wmo.int/) and of the European Centre for Medium-range Weather Forecasts ECMWF (http://www.ecmwf.int/).

Module *BufrMod* is in fact an interface. On the one hand it contains (temporary) definitions to set the arguments of the ECMWF library functions. On the other hand, it provides self explaining routines to be incorporated in the wider Fortran 90 program. Section 8.2 describes the routines in module *BufrMod*. The public available data structures are described in section 8.3. *BufrMod* uses two libraries: the BUFR software library of ECMWF and *bufrio*, a small library in C for file handling at the lowest level. These libraries are discussed in some more detail in section 8.4.

8.2 Routines

Table 8.1 provides an overview of the routines in module *BufrMod*. The most important ones are described below.

Routine	Call	Description
InitAndSetNrOfSubsets	AWDP	Initialization routine
set_BUFR_fileattributes	AWDP	Initialization routine
open_BUFR_file	AWDP	Opens a BUFR file
get_BUFR_nr_of_messages	AWDP	Inquiry of BUFR file
get_BUFR_message	AWDP	Reads instance of BufrDataType from file
get_expected_BUFR_msg_size	get_BUFR_message	Inquiry of BUFR file
ExpandBufrMessage	get_BUFR_message	Convert from <i>BufrMessageType</i> to <i>BufrSectionsType</i>

AWDP User Manual and Reference Guide Doc ID : NWPSAF-KN-UD-005 Version : 2.2 Date : June 2013

Routine	Call	Description
PrintBufrErrorCode	ExpandBufrMessage,	
	EncodeBufrData	
CheckBufrTables	ExpandBufrMessage	Data check
get_file_size	CheckBufrTables	Determine size of BUFR file
get_bufrfile_size_c	get_file_size	Support routine in C
encode_table_b	CheckBufrTables	
encode_table_d	CheckBufrTables	
FillBufrSecData	ExpandBufrMessage	Convert from <i>BufrSectionsType</i> to <i>BufrDataType</i>
close_BUFR_file	AWDP	Closes a BUFR file
BufrReal2Int	AWDP	Type conversion
BufrInt2Real	AWDP	Type conversion
save_BUFR_message	AWDP	Saves instance of BufrDataType to file
EncodeBufrData	save_BUFR_message	Convert from <i>BufrSectionsType</i> to <i>BufrMessageType</i>
CheckBufrData	EncodeBufrData	Data check
FillBufrData	EncodeBufrData	Convert from <i>BufrDataType</i> to <i>BufrSectionsType</i>
bufr_msg_is_valid	not used	
set_bufr_msg_to_invalid	not used	
PrintBufrData	not used	
<i>GetPosBufrData</i>	not used	
GetRealBufrData	not used	
GetIntBufrData	not used	
GetRealBufrDataArr	not used	
<i>GetIntBufrDataArr</i>	not used	
GetRealAllBufrDataArr	not used	
CloseBufrHelpers	not used	
missing_real	not used	
missing_int	not used	
int2real	not used	
do_range_check_int	not used	
do_range_check_real	not used	
AddRealDataToBufrMsg	not used	
AddIntDataToBufrMsg	not used	
PrintBufrModErrorCode	not used	
<i>GetFreeUnit</i>	encode_table_b,	Get free file unit
	encode_table_d	

Table 8.1 Routines of module BufrMod.

Reading (decoding): Routine *get_BUFR_message()* reads a single BUFR message from the BUFR file and creates an instance of *BufrDataType*.

Writing (encoding): Routine *save_BUFR_message()* saves a single BUFR message to the BUFR file. The data should be provided as an instance of *BufrDataType*.

Checking and Printing: The integer parameter *BufrVerbosity* controls the extent of the log statements while processing the BUFR file. The routines *PrintBufrData()* and *CheckBufrData()* can be used to respectively print and check instances of *BufrDataType*.

Open and Close BUFR files: The routine *open_BUFR_file()* opens the BUFR file for either reading (*writemode*=.false.) or writing (*writemode*=.true.). Routine *set_BUFR_fileattributes()* determines several aspects of the BUFR file and saves these data in an instance of *bufr_file_attr_data*, see table 8.5. Routine *get_BUFR_nr_of_messages()* is used to determine the number of BUFR messages in the file. Finally, routine *close_BUFR_file()* closes the BUFR file.

As said before, the underlying encoding and decoding routines originate from the ECMWF BUFR library. Appendix B3 shows the calling trees of the routines in module *BufrMod* that are used in AWDP.

8.3 Data structures

The data type closest to the actual BUFR messages in the BUFR files is the *BufrMessageType*, see table 8.2. These are still encoded data. Every BUFR message consists of 5 sections and one supplementary section. After decoding (expanding) the BUFR messages, the data are transferred into an instance of *BufrSectionsType*, see table 8.3, which contains the data and meta data in integer values subdivided in these sections.

Attribute	Туре	Description
buff	integer array	BUFR message, all sections
size	integer	Size in bytes of BUFR message
nr of words	integer	Idem, now size in words

Attribute	Туре	Description
ksup(9)	integer	Supplementary info and items selected from the other sections
ksec(3)	integer	Expanded section 0 (indicator)
ksec1(40)	integer	Expanded section 1 (identification)
ksec2(4096)	integer	Expanded section 2 (optional)
ksec3(4)	integer	Expanded section 3 (data description)
ksec4(2)	integer	Expanded section 4 (data)

Table 0.5 Attributes for the <i>Dup</i> Sections type data type.	Table 8.3	Attributes for the <i>BufrSectionsType</i> data type.
---	-----------	---

Attribute	Туре	Description
Nsec0	integer	ksup (9) dimension section 0
nsec0size	integer	ksec0(1) size section 0
nBufrLength	integer	ksec0(2) length BUFR
nBufrEditionNumber	integer	ksec0(3)
Nsec1	integer	ksup (1) dimension section 1
nsec1size	integer	ksec1(1) size section 1
kEditionNumber	integer	ksec1(2)
Kcenter	integer	ksec1(3)
kUpdateNumber	integer	ksec1(4)
kOptional	integer	ksec1(5)
ktype	integer	ksec1(6)
ksubtype	integer	ksec1(7) local use
kLocalVersion	integer	ksec1(8)
kyear	integer	ksec1(9) century year
kmonth	integer	ksec1(10)
kday	integer	ksec1(11)
khour	integer	ksec1(12)
kminute	integer	ksec1(13)
kMasterTableNumber	integer	ksec1(14)

Attribute	Туре	Description
kMasterTableVersion	integer	ksec1(15)
ksubcenter	integer	ksec1(16)
klocalinfo()	integer	ksec1(17:40)
Nsec2	integer	ksup (2) dimension section 2
nsec2size	integer	ksec2(1) size section 2
<i>key</i> (46)	integer	ksec2(2:) key
Nsec3	integer	ksup (3) dimension section 3
nsec3size	integer	ksec3(1) size section 3
Kreserved3	integer	ksec3(2) reserved
ksubsets	integer	ksec3(3) number of reserved subsets
kDataFlag	integer	ksec3(4) compressed $(0,1)$ observed $(0,1)$
Nsec4	integer	ksup (4) dimension section 4
nsec4size	integer	ksec4(1) size section 4
kReserved4	integer	ksec4(2) reserved
nelements	integer	ksup (5) actual number of elements
nsubsets	integer	ksup (6) actual number of subsets
nvals	integer	ksup (7) actual number of values
nbufrsize	integer	ksup (8) actual size of BUFR message
ktdlen	integer	Actual number of data descriptors
ktdexl	integer	Actual number of expanded data descriptors
ktdlst()	integer array	List of data descriptors
ktdexp()	integer array	List of expanded data descriptors
values()	real array	List of values
cvals()	character array	List of CCITT IA no. 5 elements
cnames()	character array	List of expanded element names
cunits()	character array	List of expanded element units

Table 8.4 Attributes of the BUFR message data type *BufrDataType*.

The next step is to bring the section data to actual dimensions, descriptions and values of data which can be interpreted as physical parameters. Therefore, instances of *BufrSectionsType* are transferred to instances of *BufrDataType*, see table 8.4. The actual data for input or output in a BUFR message should be an instance of the *BufrDataType* data type. Some meta information on the BUFR file is contained in the self explaining *bufr_file_attr_data* data type, see table 8.5.

Attribute	Туре	Description
nr_of_BUFR_mesasges	integer	Number of BUFR messages
bufr_filename	character	BUFR file
bufr_fileunit	integer	Fortran unit of BUFR file
file_size	integer	Size of BUFR file
file_open	logical	Open status of BUFR file
writemode	logical	Reading or writing mode of BUFR file
is_cray_blocked	integer	Cray system blocked?
<i>list_of_BUFR_startpointers()</i>	integer	Pointers to BUFR messages
message_is_valid()	logical	Validity of BUFR messages

 Table 8.5
 Attributes of the *bufr_file_attr_data* data type for BUFR files.

8.4 Libraries

Module BufrMod uses two libraries: the BUFR software library of ECMWF and bufrio, a small

library in C for file handling at the lowest level.

The BUFR software library of ECMWF is used as a basis to encode and decode BUFR data. This software library is explained in [*Dragosavac*, 1994].

Library *bufrio* contains routines for BUFR file handling at the lowest level. Since this is quite hard to achieve in Fortran, these routines are coded in C. The routines of *bufrio* are listed in table 8.6. The source file (bufrio.c) is located in subdirectory genscat/support/bufr.

Routine	Call	Description
bufr_open	open_BUFR_file	Open file
bufr_split	open_BUFR_file	Find position of start of messages in file
bufr_read_allsections	get_BUFR_message	Read BufrMessageType from BUFR file
bufr_get_section_sizes	get_BUFR_message	
bufr_swap_allsections	get_BUFR_message, save_BUFR_message	Optional byte swapping
bufr_write_allsections	save_BUFR_message	Write <i>BufrMessageType</i> to BUFR file
bufr_close	close_BUFR_file	
bufr_error	see appendix B.3	Error handling

Table 8.6Routines in library *bufrio*.

8.5 **BUFR table routines**

BUFR tables are used to define the data descriptors. The presence of the proper BUFR tables is checked before calling the reading and writing routines. If absent, it is tried to create the needed BUFR tables from the text version, available in genscat.

8.6 Centre specific modules

BUFR data descriptors are integers. These integers consist of class numbers and numbers for the described parameter itself. These numbers are arbitrary. To establish self documenting names for the BUFR data descriptors for a Fortran 90 code several centre specific modules are created. These modules are listed in table 8.7. Note that these modules are just cosmetic and not essential for the encoding or decoding of the BUFR data. They are not used in AWDP.

Module	Description
WmoBufrMod	WMO standard BUFR data description
KnmiBufrMod	KNMI BUFR data description
<i>EcmwfBufrMod</i>	ECMWF BUFR data description

Table 8.7	Fortran 90 l	BUFR modules.

Chapter 9

Module gribio_module

Module *gribio_module* is part of the genscat support modules. The current version is a Fortran 90 wrapper around the ECMWF GRIB API library (see <u>http://www.ecmwf.int/</u>). The goal of this support module is to provide a comprehensive interface to GRIB data for every Fortran 90 program using it. In particular, *gribio_module* provides all the GRIB functionality required for the scatterometer processor based on genscat. Special attention has been paid to testing and error handling.

9.1 Background

The acronym GRIB stands for GRIdded Binary. GRIB is maintained by the World Meteorological Organization WMO and other meteorological centres. In brief, the WMO FM-92 GRIB definition is a binary format for efficiently transmitting gridded meteorological data. It is beyond the scope of this document to describe GRIB in detail. Complete descriptions are distributed via the websites of WMO (http://www.wmo.int/) and of the European Centre for Medium-range Weather Forecasts ECMWF (http://www.ecmwf.int/).

Module *gribio_module* is in fact an interface. On the one hand it contains (temporary) definitions to set the arguments of the ECMWF library functions. On the other hand, it provides self explaining routines to be incorporated in the wider Fortran 90 program. Section 9.2 describes the routines in module *gribio_module*. The available data structures are described in section 9.3. The *gribio_module* uses two libraries: from the GRIB software library of ECMWF. This is discussed in some more detail in section 9.4.

9.2 Routines

Table 9.1 provides an overview of the routines in module *gribio_module*. The most important ones are described below.

Routine	Call	Description
init_GRIB_module	AWDP	Initialization routine
dealloc_all_GRIB_messages	AWDP	Clear all GRIB info from memory and close GRIB files
set_GRIB_filelist	AWDP	Open all necessary GRIB files
get_from_GRIB_filelist	AWDP, get colloc from GRIB filelist	Retrieve GRIB data for a given lat and lon
inquire_GRIB_filelist	AWDP,	Inquiry of GRIB file list

Routine	Call	Description
	get_analyse_dates_and_times,	
	get_colloc_from_GRIB_filelist	
get_colloc_from_GRIB_filelist	AWDP	Retrieve time interpolated GRIB data for a
		given lat and lon
get_GRIB_msgnr	get_field_from_GRIB_file,	Inquiry of GRIB file list
	get_from_GRIB_file,	
	get_from_GRIB_filelist,	
	inquire_GRIB_filelist	
display_req_GRIB_msg_properties	get_GRIB_msgnr,	Prints GRIB message info
	get_from_GRIB_filelist	
display_GRIB_message_properties	get_GRIB_msgnr,	Prints GRIB message info
	get_from_GRIB_filelist	
open_GRIB_file	get_field_from_GRIB_file,	Open GRIB file and get some header
	get_from_GRIB_file,	information from all messages in this file
	set_GRIB_filelist,	
read GRIB header info	add_to_GRIB_filelist open GRIB file	Dond hander part of a CDID massage
extract data from GRIB message	get from GRIB file,	Read header part of a GRIB message Interpolate data from four surrounding
extruct_uutu_from_ONID_message	get_from_GRIB_filelist	points for a given lat and lon
get GRIB data values	get_field from GRIB file,	Read all data from GRIB message
gei_OMD_uuiu_vuiues	get_from_GRIB_file,	Read an data from OKID message
	get_from_GRIB_filelist	
dealloc GRIB message	open GRIB file,	Clear GRIB message from memory
ucunoc_010D_message	dealloc_all_GRIB_messages,	clear Grab message nom memory
	get field from GRIB file	
get analyse dates and times	get colloc from GRIB filelist	Helper routine
check proximity to analyse	get colloc from GRIB filelist	Helper routine
get field from GRIB file	not used	1
get from GRIB file	not used	
add_to_GRIB_filelist	not used	

Table 9.1 Routines of module gribio_module.

Reading: Routine set_GRIB_filelist reads GRIB messages from a list of files, decodes them and makes the data accessible in a list of GRIB messages in memory.

Retrieving: Routine *get_from_GRIB_filelist()* returns an interpolated value (four surrounding grid points) from the GRIB data in the list of files/messages for a given GRIB parameter, latitude and longitude. It is also possible to get a weighted value of all grid points lying within a circle around the latitude and longitude of interest. This is used in the land fraction calculation in AWDP. The land fraction is calculated by scanning all grid points of the land-sea mask lying within 80 km from the centre of the WVC. Every grid point found yields a land fraction (between 0 and 1). The land fraction of the WVC is calculated as the average of the grid land fractions, where each grid land fraction has a weight of $1/r^2$, *r* being the distance between the WVC centre and the model grid point.

Routine *get_colloc_from_GRIB_filelist()* returns an interpolated value (four surrounding grid points) from the GRIB data in the list of files/messages for a given GRIB parameter, latitude, longitude, and time. The list of messages must contain a sequence of forecasts (e.g. +3 hrs, +6 hrs, +9 hrs, et cetera). At least three forecasts need to be provided; ideally two lying before the sensing time and one after.

---- | ----- | ----- | -----

1 2 ^ 3

In this diagram, the 1, 2, and 3 mean the three forecast steps with intervals of three hours between them. The $^$ is the sensing time. The software will perform a cubic time interpolation. Note that the 1, 2 and 3 in the diagram may correspond to +3, +6 and +9 forecasts, but also e.g. to +9, +12 and +15. If more forecasts are provided, e.g. like this:

----|-----|-----|-----1 2 3 ^ 4 5

the software will use forecast steps 2, 3, and 4, i.e., it will pick the most usable values by itself. If one forecast before, and two after are provided:

----|-----|-----1 ^ 2 3

the software will still work, and use all three forecasts.

Checking and Printing: The integer parameter *GribVerbosity* controls the extent of the log statements while processing the GRIB data.

As said before, the underlying encoding and decoding routines originate from the ECMWF GRIB library. Appendix B4 shows the calling trees of the routines in module *gribio_module* that are used in AWDP.

9.3 Data structures

Some meta information on the GRIB file is contained in the self explaining grib_*file_attr_data* data type, see table 9.2.

The decoded GRIB messages in the GRIB files, with their meta information, are contained in the *grib_message_data*, see table 9.3.

Attribute	Туре	Description
nr_of_GRIB_messages	integer	Number of messages in this file
grib_filename	character array	Name of GRIB file
grib_fileunit	integer	Unit number in file table
file_size	integer	Size of GRIB file in bytes
file_open	logical	Status flag
list_of_GRIB_message_ids	integer array	Message ids assigned by GRIB API
list_of_GRIB_level	integer array	Key to information in messages
list_of_GRIB_level_type	integer array	Key to information in messages
list_of_GRIB_date	integer array	Key to information in messages
list_of_GRIB_hour	integer array	Key to information in messages
list_of_GRIB_analyse	integer array	Key to information in messages
list_of_GRIB_derived_date	integer array	Key to information in messages
list_of_GRIB_derived_hour	integer array	Key to information in messages

Attribute	Туре	Description
list_of_GRIB_par_id	integer array	Key to information in messages
list_of_GRIB_vals_sizes	integer array	Size of data values arrays

Table 9.2 Attributes for the grib_file_attr_data data type.

Attribute	Туре	Description
message_pos_in_file	integer	Position of message in GRIB file
message_id	integer	Message id assigned by GRIB API
date	real	Date when data are valid
time	real	Time when data are valid
derived date	real	date $+$ time/24
derived time	real	mod(time/24)
total message size	integer	Size of message
vals size	integer	Size of data values array
is decoded	logical	Status flag
nr_lon_points	integer	Information about grid
nr lat points	integer	Information about grid
nr_grid_points	integer	Information about grid
lat of first gridpoint	real	Information about grid
lat of last gridpoint	real	Information about grid
lon_of_first_gridpoint	real	Information about grid
lon_of_last_gridpoint	real	Information about grid
lat_step	real	Information about grid
lon_step	real	Information about grid
real_values	real array, pointer	Decoded real data values

 Table 9.3
 Attributes for the grib_message_data data type.

Attribute	Туре	Description
grib_file_attributes	grib_file_attr_data	GRIB file attributes
list_of_GRIB_msgs	grib_message_data array	List of messages in file

Table 9.4 Attributes of the *list_of_grib_files_type* data type for GRIB files.

9.4 Libraries

Module *gribio_module* uses two libraries: from the GRIB API software library of ECMWF: libgrib_api.a and libgrib_api_f90.a. The GRIB API software library of ECMWF is used as a basis to decode GRIB data. This software library is explained on <u>http://www.ecmwf.int/</u>.

Appendix A

Calling tree for AWDP

The figures in this appendix show the calling tree for the AWDP program. Routines in white boxes are part of the AWDP process layer. Routines in black boxes are part of genscat. An arrow (\rightarrow) before a routine name indicates that this part of the calling tree is a continuation of a branch in a previous figure. The same arrow after a routine name indicated that this branch will be continued in a following figure.

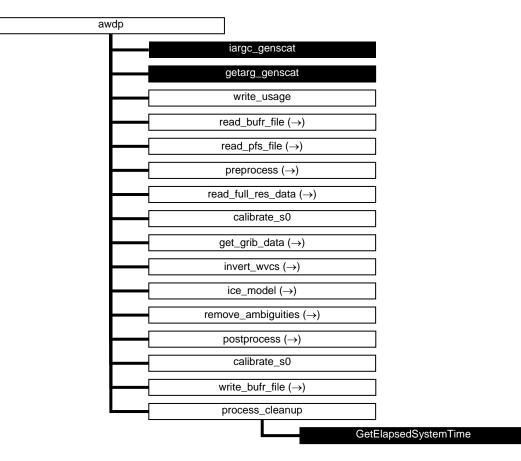

Figure A.1 Calling tree for program *awdp* (top level). White boxes are cut here and will be continued in one of the first level or second level calling trees in the next figures. Black boxes with light text indicate genscat routines.

Table C.1 List of data descriptors. Note that descriptor numbers 93-96 can be repeated 1 to 144 times, depending on the value of the Delayed Descriptor Replication Factor (descriptor number 92)

Appendix D

Acronyms

Name	Description
AMI	Active Microwave Instrument, scatterometer on ERS-1 and ERS-2 satellites
AR	Ambiguity Removal
ASCAT	Advanced SCATterometer on Metop
BUFR	Binary Universal Form for the Representation of data
C-band	Radar wavelength at about 5 cm
ERS	European Remote Sensing satellites
ECMWF	European Centre for Medium-range Weather Forecasts
EUMETSAT	European Organization for the Exploitation of Meteorological Satellites
genscat	generic scatterometer software routines
GMF	Geophysical model function
HIRLAM	High resolution Local Area Model
KNMI	Koninklijk Nederlands Meteorologisch Instituut (Royal Netherlands Meteorologica Institute)
Ku-band	Radar wavelength at about 2 cm
L1b	Level 1b product
LIU	Land Sea Mask
LUT	Look up table
Metop	Meteorological Operational Satellite
MLE	Maximum Likelihood Estimator
MSS	Multiple Solution Scheme
NRCS	Normalized Radar Cross-Section (σ^0)
NWP	Numerical Weather Prediction
OSI	Ocean and Sea Ice
PFS	Product Format Specification (native Metop file format)
QC	Quality Control
RFSCAT	Rotating Fan beam Scatterometer
RMS	Root Mean Square
SAF	Satellite Application Facility
SSM	Surface Soil Moisture
SST	Sea Surface Temperature
WVC	Wind Vector Cell, also called node or cell

Table D.1List of acronyms.
