# WEERTYPE-KLIMATOLOGIE VOOR DE BILT, 1881 - 1970

door

C.J.E. Schuurmans en H.J. Krijnen

## 1. Inleiding

Het weer is een samengesteld begrip. De elementen waarin het ontleed kan worden zijn o.a. wind, temperatuur, luchtvochtigheid, neerslag, bewolkingstoestand (zonneshijn). Daarnaast kennen we het begrip cirkulatie, waarmee karakteristieken van het stromingspatroon van de atmosfeer boven een bepaald gebied worden weergegeven. Tussen de cirkulatie en het weer bestaat een verband. Kennis van dit verband is in het huidige stadium van de numerieke dynamische meteorologie bijzonder nuttig, omdat cirkulatieveranderingen tot 3 à 4 dagen vooruit wel berekend kunnen worden, maar het weer zelf nog niet. Een veelgebruikte "vertaling" van cirkulatie in weer is de publikatie van Bijvoet en Schmidt: "Het weer in Nederland in afhankelijkheid van cirkulatietypen", W.R. 58-4. Deel I (De Bilt). Hierin is voor ieder element afzonderlijk (temperatuur, neerslag, enz.) een verband gelegd met de cirkulatie boven Europa. De cirkulatie is daartoe onderscheiden in typen en wel volgens het Duitse klassifikatiesysteem, dat bekend is onder de naam Grosswetterlagen Europas.

Voortbouwend op genoemde publikatie is een nieuw onderzoek gedaan naar het verband tussen het weer en cirkulatietypen. Nu echter niet voor ieder element afzonderlijk, maar voor een combinatie van 3 elementen, t.w. temperatuur, neerslag en zonneshijn.

Door ieder van deze 3 elementen in klassen te verdelen zijn meerdere combinaties mogelijk. Deze combinaties hebben de naam weertypen gekregen. Het resultaat van het onderzoek is dan ook het verband tussen cirkulatietypen en weertypen.

Als bijprodukt van dit onderzoek ontstond een weertype-klimatologie voor De Bilt, betrekking hebbend op het tijdvak 1881 - 1970. Naast een weertype-kalender, die voor iedere dag in genoemde periode het weertype aangeeft, zijn nog een aantal tabellen met frekwentieverdelingen opgenomen die een indruk geven van de jaarlijkse gang in het voorkomen van de verschillende weertypen en van de verschillen tussen de jaren onderling.

## 2. Definities

Definitie weertype: onder weertype (afgekort WTP) wordt hier verstaan de combinatie van de drie elementen temperatuur, neerslag en zonneshijn.

Voor elk element is een indeling gemaakt in 3 klassen, waardoor het aantal combinaties (en dus het aantal weertypen)  $3 \times 3 \times 3 = 27$  bedraagt.

De indeling is gebaseerd op daggetallen, d.w.z. voor de temperatuur is het 24-uurgemiddelde gebruikt, voor de neerslag de dagsom tussen 0 en 24 uur en voor de zonneshijn het dagelijkse percentage.

De klassegrenzen zijn als volgt vastgelegd:

Temperatuur: de etmaalgemiddelden over de periode 1881 - 1965 zijn per dekade in tercilen ingedeeld. De grenzen tussen deze tercilen zijn de klassegrenzen, en wel zodanig dat de grenswaarden zelf tot de extreme klassen behoren. Zo ontstaan de beneden normale, normale en boven normale temperatuurklasse, afgekort tot resp. B (below normal), N (normal) en A (above normal). Voor de grenswaarden zie Tabel I.

Neerslag: hiervoor zijn vaste klassegrenzen genomen; 0.2 mm of minder is droog,

afgekort D (dry), 0.3 t/m 4.9 mm is een matige hoeveelheid neerslag, afgekort M (moderate) en 5.0 mm of meer is veel neerslag, afgekort H (heavy precipitation).

Zonneschijn: ook hiervoor vaste grenzen en wel 25% zonneschijn of minder is C (cloudy), 26 t/m 49% is P (partial) en 50% of meer zon is S (sunny).

De symbolen van de WTP's zijn gegeven in de volgorde: temperatuur, neerslag, zon.

N.B. De klassegrenzen voor de etmaalgemiddelden van de temperatuur, zoals die zijn vastgesteld voor de periode 1881 - 1965, zijn ook aangehouden voor de jaren 1966 - 1970. Algemeen kan worden gesteld, dat bij dit onderzoek de voorkeur is gegeven aan klassegrenzen over een lange periode (85 jaar), boven de internationaal gebruikelijke 30 jaar. Het gekozen tijdvak (85 jaar) komt bovendien goed overeen met een gesloten cyclus van de 80 - 90 jarige periode, welke zich volgens sommige onderzoeken in de algemene cirkulatie en in het klimaat aftekent.

Tabel I. Tercilen en gemiddelden van de etmaaltemperatuur in Lk. BILT per dekade over het tijdvak 1881-1965

maand	dekade	tercilen (in graden C)	gemiddelde (in graden C)	maand	dekade	tercilen (in graden C)	gemiddelde (in graden C)

### 3. Tabellen voor De Bilt

#### Tabel 1 WTP kalender 1881 - 1970

Van 1 jan. 1881 - 31 dec. 1970 wordt dagelijks het WTP gegeven. De WTP zijn per maand op één pagina gerangschikt, zodat de kalender in totaal 12 pagina's beslaat.

#### Tabel 2 Frekwentieverdeling van WTP, in procenten over 90 jaar

Op één pagina is de maandelijks-, seizoens-, en jaarlijkse frekwentieverdeling van de WTP over de volledige periode van 90 jaar, weergegeven.

#### Tabel 3 Aantal dagen met een gegeven WTP, voor ieder jaar afzonderlijk

Deze tabel beslaat 17 pagina's en geeft de aantallen per maand, per seizoen en per jaar, voor ieder van de jaren 1881 - 1970 afzonderlijk.

#### Tabel 4 Frekwentieverdeling van WTP, in procenten, voor iedere dag afzonderlijk

Voor ieder van de 365 dagen van het jaar is de frekwentieverdeling van de WTP, over de volledige periode van 90 jaar berekend. De dagen zijn per twee maanden gerangschikt op één pagina, waardoor de tabel een omvang heeft gekregen van 6 pagina's. Voor 29 februari is de frekwentieverdeling niet in procenten gegeven, maar in aantallen dagen.

### 4. Enkele suggesties voor het gebruik van het WTP-materiaal

#### 4.1 Klimatologisch naslagwerk

De weertype kalender (tabel 1) geeft voor iedere dag in de periode 1881 - 1970 snel een indicatie over het weer dat op die dag in De Bilt is waargenomen.

Tabel 4 geeft voor iedere dag van het jaar het klimatologisch te verwachten weer.

M.b.v. tabel 3 kan in een oogopslag worden vastgesteld welke maanden, seizoenen of jaren uitzonderlijk weer hebben opgeleverd.

#### 4.2 Selektie van analogen

M.b.v. de weertypekalender kunnen analoge opeenvolgingen van de WTP over een gegeven periode worden opgezocht om te zien of deze in hun vervolg ook hetzelfde weer opleveren. Indien dit het geval is, zouden WTP-analogen, eventueel naast of in combinatie met cirkulatie-analogen, als basis kunnen dienen voor langere termijnverwachtingen.

#### 4.3 Onderzoek singulariteiten

Tabel 2 en tabel 4 geven, respectievelijk in globale en gedetailleerde zin, de gemiddelde jaarlijkse gang van ieder weertype weer. Kalendergebonden afwijkingen van het regelmatige verloop, veelal singulariteiten genoemd, kunnen worden opgespoord en op hun significantie getest.

#### 4.4 Onderzoek klimaatschommelingen

M.b.v. tabel 3 kan worden onderzocht of zich in de periode 1881 - 1970 verschillen van jaar-op-jaar, of van decenium-op-decenium, hebben voorgedaan

in het voorkomen van de verschillende weertypen.

Een eerste onderzoek van de gegevens, o.a. ter verifikatie van de door Engelse onderzoekers gevonden 2-jarige periode in het Engelse zomerweer (zie bijv. N.E. Davis, The summers of North-west Europe, The Meteorological Magazine, Vol. 96, p. 178 - 187, 1967) heeft het volgende resultaat opgeleverd.

In Nederland (De Bilt) wordt de zomer vooral bepaald door het aantal dagen met het weertype ADS (warm, droog en zonnig). Zoals uit tabel 2 blijkt, komt dit type ook in de maanden april, mei en september zeer frekvent voor. Bij grote aantallen ADS in deze maanden spreekt men van een mooie voorzomer, resp. nazomer. In de wintermaanden komt het weertype ADS slechts sporadisch voor.

In tabel 3 kan men zien dat de jaartotalen van het weertype ADS zeer sterk uiteenlopen. Extreem in dit opzicht zijn de jaren 1947 met 88 ADS-dagen en 1962 met slechts 13 ADS-dagen. Om na te gaan of, zoals in Engeland, de zomers van oneven jaren beter zijn dan die van de even jaren, zijn de ADS-dagen van oneven en even jaren afzonderlijk opgeteld. Het resultaat is als volgt:

45 oneven jaren 1881 - 1969 totaal	1806 dagen ADS
45 even jaren 1882 - 1970 totaal	1545 " ADS

M.b.v. de  $X^2$ -test kan worden aangetoond dat het verschil tussen deze getallen statistisch significant is, m.a.w. wat voor de Engelse zomers is gevonden, blijkt ook voor de Nederlandse op te gaan.

Aan dit resultaat kan nog worden toegevoegd, dat de regel: de zomers van oneven jaren zijn beter (tellen meer dagen ADS) dan die van de voorafgaande even jaren, beter voldoet dan de regel: de zomers van de even jaren zijn slechter dan die van de voorafgaande oneven jaren. Eerstgenoemde regel blijkt volgens de tekentoets statistisch significant te zijn, de tweede niet.

#### Verantwoording

De temperatuur, neerslag- en zonneshijngegevens die de basis vormen van dit rapport zijn afkomstig van het Grosswetterlage-ponskaartenbestand van de Afdeling Weerdienst en Luchtvaartmeteorologie. Deze gegevens werden door de rekensectie van genoemde afdeling, onder leiding van achtereenvolgens C.I. Bakker, I.C. van der Klippe en G.W. Brouwer, in hoofdzaak ontleend aan de Jaarboeken A van het K.N.M.I.

Het komputerprogramma voor de bewerking van de gegevens werd geschreven door A. Burger.
